Gnuplot is a command-line driven interactive function plotting program. Originally intended as a means to stimulate students' interest in mathematics, it has been used in scientific fields for over a decade. Gnuplot is capable of plotting 2D functions and data in various styles, and 3D functions and data in the form of surfaces and contour maps. Gnuplot can output to a variety of formats, including PostScript, PNG, and SVG.

Gnuplot is a portable command-line driven interactive data and function plotting utility for UNIX, IBM OS/2, MS Windows, DOS, and many other platforms. It was originally intended for students to explore mathematical functions and data in a friendly way, but has been used for many scientific and engineering applications since then. Gnuplot supports many types of plots in either 2D or 3D. It can plot functions and data read from ASCII files. Gnuplot can output to a variety of formats, including PNG, PostScript, and SVG.

Numerous works have recently shown that state-of-the-art classifiers are vulnerable to adversarial perturbations. We extend the study of adversarial examples to more complex vision tasks, namely semantic segmentation and object detection. We show that adversarial examples can also be easily generated for these tasks, and that they transfer across datasets and models. We also show that adversarial training can be used to defend against such examples, and that it leads to improved robustness.

Sub-Interface - Layer3 Subinterface

Palo Alto Networks firewalls support Layer 3 routing on subinterfaces to accommodate multiple virtual routers and security zones on a single physical interface. The ability to define subinterfaces is useful when you want to route traffic for multiple virtual routers or security zones through a single physical interface. Each subinterface can be assigned to a different virtual router and security zone. Each subinterface can be configured with its own IP address, static routes, RIP, OSPF, BGP, or multicast routing protocol. Subinterfaces are also useful if you have a firewall that is connected to a switch that is configured for multiple VLANs. You can define a subinterface for each VLAN and assign traffic from each VLAN to a different virtual router and security zone.

Configure a Layer3 Subinterface on the GUI

Step 1. Define the parent interface. Select Network > Interfaces and click the interface name. Select Interface Type Layer3 and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 2. Define the subinterface. Select Network > Interfaces and click Add Subinterface. Enter the Interface Name in the format eth<slot>.<port_number>. Enter the Tag (VLAN ID) and Virtual Router. Select the Security Zone and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 3. Commit the changes. Click Commit.

Verify Layer3 Subinterface Configuration on the GUI

Step 1. Verify the parent interface. Select Network > Interfaces and click the interface name. Select Interface Type Layer3 and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 2. Verify the subinterface. Select Network > Interfaces and click Add Subinterface. Enter the Interface Name in the format eth<slot>.<port_number>. Enter the Tag (VLAN ID) and Virtual Router. Select the Security Zone and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 3. Commit the changes. Click Commit.

1914 translation by H. Rackham

"But I must explain to you how all this mistaken idea of denouncing pleasure and praising pain was born and I will give you a complete account of the system, and expound the actual teachings of the great explorer of the truth, the master-builder of human happiness. No one rejects, dislikes, or avoids pleasure itself, because it is pleasure, but because those who do not know how to pursue pleasure rationally encounter consequences that are extremely painful. Nor again is there anyone who loves or pursues or desires to obtain pain of itself, because it is pain, but because occasionally circumstances occur in which toil and pain can procure him some great pleasure. To take a trivial example, which of us ever undertakes laborious physical exercise, except to obtain some advantage from it? But who has any right to find fault with a man who chooses to enjoy a pleasure that has no annoying consequences, or one who avoids a pain that produces no resultant pleasure?"

이사회 의장 주주 제안서

제1조 (제안의 목적)

제1조 (제안의 목적) 본 제안서는 주주 김지훈이 이사회 의장 선임을 제안하기 위해 작성되었다. 의장 선임은 이사회 운영 전반에 대한 주주 권리 행사의 가장 직접적인 수단이다. 의장은 의제 설정, 회의 진행, 의결 정리, 이사회 의사록 작성 등 이사회 운영 전반에 대한 권한을 가진다. 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 이사 선임 제안은 시간이 걸리지만, 의장 선임은 다음 이사회 한 번이면 된다.

제2조 (의장 선임 제안의 근거)

제2조 (의장 선임 제안의 근거) 의장 선임 제안은 세 가지 근거에 기한다. 첫째, 현 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다. 둘째, 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 셋째, 의장은 의제 설정, 회의 진행, 의결 정리, 이사회 의사록 작성 등 이사회 운영 전반에 대한 권한을 가진다.

제3조 (의사록 미작성 사실)

제3조 (의사록 미작성 사실) 2024년 3월 이사회 의사록 미작성 사실은 이사회 의사록 작성 의무를 지키지 않았다는 것을 보여준다. 의사록 작성 의무는 이사회 의장의 의무다. 의사록 미작성 사실은 의장 김민수가 이사회 의사록 작성 의무를 지키지 않았다는 것을 보여준다.

제4조 (의장 김민수의 의사록 작성 의무 불이행)

제4조 (의장 김민수의 의사록 작성 의무 불이행) 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다. 의사록 작성 의무는 이사회 의장의 의무다. 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다.

제5조 (의장 선임 제안의 효과)

제5조 (의장 선임 제안의 효과) 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 이사 선임 제안은 시간이 걸리지만, 의장 선임은 다음 이사회 한 번이면 된다. 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다.

1.1 Introduction

1.1.1 Why Study Differential Equations?

Differential equations are equations involving derivatives of unknown functions. For example, the equation

$$\frac{dy}{dx} = 2x + 3$$

is a differential equation. Here, y is a function of x, and $\frac{dy}{dx}$ represents the rate at which y changes with respect to x.

Differential equations are fundamental in mathematics because they describe how quantities change over time or in response to other variables. For example, Newton's Second Law, $F = ma$, can be rewritten as $F = m\frac{d^2x}{dt^2}$, where $x(t)$ is the position of an object at time t. This equation allows us to predict the motion of the object by solving for $x(t)$.

Differential equations are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the equation $L\frac{dI}{dt} + RI = V(t)$. Solving this equation allows us to predict how the current changes over time.

1.1.2 Ordinary Differential Equations (ODEs)

An ordinary differential equation (ODE) is a differential equation in which the unknown function depends on a single variable. For example, the equation $\frac{dy}{dx} = 2x + 3$ is an ODE because y depends only on x.

ODEs are used to model systems where the rate of change of a quantity depends on the quantity itself and other factors. For example, the population of a city may be modeled by the ODE $\frac{dP}{dt} = kP$, where $P(t)$ is the population at time t and k is a constant representing the growth rate.

ODEs are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the ODE $L\frac{dI}{dt} + RI = V(t)$. Solving this ODE allows us to predict how the current changes over time.

1.1.3 Partial Differential Equations (PDEs)

A partial differential equation (PDE) is a differential equation in which the unknown function depends on multiple variables. For example, the equation $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ is a PDE because u depends on both x and t.

PDEs are used to model systems where the rate of change of a quantity depends on the quantity itself and other factors. For example, the heat equation $\frac{\partial u}{\partial t} = k\frac{\partial^2 u}{\partial x^2}$ describes how the temperature $u(x,t)$ changes over time and space, where k is a constant representing the thermal conductivity.

PDEs are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the PDE $L\frac{\partial I}{\partial t} + RI = V(t)$. Solving this PDE allows us to predict how the current changes over time and space.

Chapter Chapter 1

Section Introduction

Subsection Introduction to Linear Algebra

Linear Algebra

Linear Algebra

Linear Algebra is the study of vectors and linear transformations between vector spaces.

Example 1.1.1

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Let $T: V \to W$ be defined by

$$T(x, y, z) = (x + y, 2z - x).$$

Then T is a linear transformation.

Proof.

Let $u = (x_1, y_1, z_1)$ and $v = (x_2, y_2, z_2)$ be arbitrary elements of V and let $c \in \mathbb{R}$ be arbitrary.

Then $u + v = (x_1 + x_2, y_1 + y_2, z_1 + z_2)$ and

$$T(u + v) = (x_1 + x_2 + y_1 + y_2, 2(z_1 + z_2) - (x_1 + x_2)) = (x_1 + y_1, 2z_1 - x_1) + (x_2 + y_2, 2z_2 - x_2) = T(u) + T(v).$$

Also, $cu = (cx_1, cy_1, cz_1)$ and

$$T(cu) = (cx_1 + cy_1, 2cz_1 - cx_1) = c(x_1 + y_1, 2z_1 - x_1) = cT(u).$$

Therefore T satisfies both conditions of linearity and is a linear transformation. $\square$

Example 1.1.2

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Let $T: V \to W$ be defined by

$$T(x, y, z) = (x + y, 2z - x + 1).$$

Then T is not a linear transformation because $T(0, 0, 0) = (0, 1) \neq (0, 0)$.

Example 1.1.3

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Abstract: In this paper, we study the Cauchy problem for the nonlinear Kirchhoff-Carrier wave equation in a bounded domain. We prove that the solution exists globally in time and decays to zero as time tends to infinity.

Topic:

Question:

Find a unit tangent vector to the curve $r(t) = \langle \sin(t), \cos(t), \sqrt{2}t \rangle$ at the point $(0, 1, \pi\sqrt{2}/4)$.

Solution:

Step 1: Find the derivative $r'(t)$ of the position vector $r(t)$.

$$r'(t) = \langle \cos(t), -\sin(t), \sqrt{2} \rangle$$

Step 2: Evaluate $r'(t)$ at the point $t = \pi/4$ (since $\sin(\pi/4) = \cos(\pi/4) = 1/\sqrt{2}$).

$$r'(\pi/4) = \langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle$$

Step 3: Find the magnitude of $r'(\pi/4)$.

$$|r'(\pi/4)| = \sqrt{(1/\sqrt{2})^2 + (-1/\sqrt{2})^2 + (\sqrt{2})^2} = \sqrt{1/2 + 1/2 + 2} = \sqrt{3}$$

Step 4: Divide $r'(\pi/4)$ by its magnitude to find the unit tangent vector.

$$T(\pi/4) = \frac{r'(\pi/4)}{|r'(\pi/4)|} = \frac{\langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle}{\sqrt{3}} = \langle 1/\sqrt{6}, -1/\sqrt{6}, \sqrt{2/3} \rangle$$

Step 5: Rationalize the denominators.

$$T(\pi/4) = \langle \sqrt{6}/6, -\sqrt{6}/6, \sqrt{6}/3 \rangle$$

Step 6: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 99: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 100: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 101: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 102: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 103: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 104: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 105: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 106: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 107: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 108: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 109: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 110: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 111: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 112: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 113: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 114: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 115: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 116: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 117: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 118: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 119: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 120: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 121: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1}

Abstract
This study investigates the effect of pulsed laser ablation in liquid (PLAL) parameters on the synthesis of gold nanoparticles (AuNPs) using a Nd:YAG laser. The influence of laser fluence (2–6 J/cm²), pulse repetition rate (10–50 Hz), and ablation time (5–30 min) on the size, shape, and optical properties of AuNPs was evaluated. Results showed that increasing laser fluence and repetition rate reduced average particle size from 18 nm to 9 nm, while prolonged ablation time led to aggregation and broadening of the size distribution. UV-Vis spectroscopy confirmed the formation of AuNPs with surface plasmon resonance peaks between 520 and 540 nm. The optimal conditions for producing small, spherical AuNPs were identified as 4 J/cm², 30 Hz, and 15 min. These findings provide a systematic approach for tailoring AuNP properties by controlling laser parameters, which is crucial for their application in biomedicine and catalysis.

Lycopene is a red carotenoid of great importance because it is responsible for the pigment of tomatoes and other red fruits and vegetables and because it has been associated with many health benefits. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Here we report that the transcription factor RIPENING INHIBITOR (RIN) binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Lycopene is a red carotenoid that is responsible for the pigment of tomatoes and other red fruits and vegetables. Lycopene is a precursor of provitamin A and has been associated with many health benefits, such as a reduced risk of cardiovascular disease and certain cancers[1–3]. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Tomato fruits are a major source of lycopene, and lycopene accumulation in tomato fruits is a complex process that is affected by many factors, such as ripening, ethylene, light, temperature, and genotype[4–7]. Ripening-inhibitor (rin) is a recessive mutant that has been used extensively in studies of tomato fruit ripening. The rin mutant fruits do not ripen and do not accumulate lycopene, even in the presence of ethylene[8]. The RIN gene encodes a MADS-box transcription factor that is a master regulator of fruit ripening in tomato[9–12]. Although the RIN protein has been shown to bind to the promoters of several genes that are involved in ethylene biosynthesis and signal transduction, the genes that are directly regulated by RIN and the mechanism by which RIN regulates lycopene accumulation are unknown. Here we show that RIN binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Abstract

This study presents a variational approach to simulate the electron density distribution in the hydrogen molecular ion (H_2^+) using trial wavefunctions and numerical optimization techniques. The ground state energy and electron density are calculated for various internuclear distances and compared with exact results. The results show that the variational method provides accurate electron density distributions with minimal computational cost. The study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems.

1. Introduction

The hydrogen molecular ion (H_2^+) is the simplest molecular system and serves as a fundamental benchmark for quantum mechanical calculations. Despite its simplicity, it exhibits all the essential features of chemical bonding, including electron sharing between two nuclei and the formation of a stable molecular orbital. The study of H_2^+ provides insights into the nature of chemical bonds and serves as a test case for more complex molecular systems.

The electron density distribution in H_2^+ is crucial for understanding the nature of the chemical bond. The electron density determines the strength of the bond, the bond length, and the vibrational frequencies. Accurate calculation of electron density is essential for predicting molecular properties and understanding chemical reactivity.

Variational methods are powerful tools for calculating molecular properties. These methods provide upper bounds to the ground state energy and allow for the calculation of electron density distributions. The variational method is particularly useful for systems where exact solutions are not available.

This study presents a variational approach to simulate the electron density distribution in H_2^+. The study compares the results with exact calculations and demonstrates the effectiveness of simple variational methods for quantum mechanical simulations.

2. Theoretical Background

2.1 Schrödinger Equation

The time-independent Schrödinger equation for H_2^+ is:

$$H\psi = E\psi$$

where H is the Hamiltonian operator, ψ is the wavefunction, and E is the energy.

2.2 Hamiltonian Operator

The Hamiltonian operator for H_2^+ is:

$$H = -\frac{\nabla_1^2}{2} - \frac{\nabla_2^2}{2} - \frac{1}{r_{a1}} - \frac{1}{r_{b1}} + \frac{1}{R}$$

where ∇_1^2 and ∇_2^2 are the Laplacian operators for electrons 1 and 2, r_{a1} and r_{b1} are the distances from electron 1 to nuclei a and b, and R is the internuclear distance.

2.3 Variational Principle

The variational principle states that for any trial wavefunction ψ_{trial}, the energy E_{trial} satisfies:

$$E_{trial} = \frac{\langle \psi_{trial} | H | \psi_{trial} \rangle}{\langle \psi_{trial} | \psi_{trial} \rangle} \geq E_0 \quad (1)$$

where E_0 is the ground state energy.

2.4 Trial Wavefunction

The trial wavefunction used in this study is:

$$\psi_{trial} = \frac{1}{\sqrt{2(1+S)}}(\phi_a + \phi_b) \quad (2)$$

where ϕ_a and ϕ_b are hydrogen 1s orbitals centered on nuclei a and b, and S is the overlap integral between these orbitals.

3. Methodology

3.1 Computational Approach

The computational approach involves the following steps:

1. Calculation of overlap integrals
2. Calculation of kinetic energy integrals
3. Calculation of potential energy integrals
4. Optimization of the variational parameter
5. Calculation of electron density distribution

3.2 Overlap Integral

The overlap integral between two hydrogen 1s orbitals is:

$$S = \int \phi_a \phi_b \, d\tau = \left(1 + \frac{R}{a_0} + \frac{R^2}{3a_0^2}\right) e^{-R/a_0} \quad (3)$$

where a_0 is the Bohr radius.

3.3 Kinetic Energy Integral

The kinetic energy integral is:

$$T = \int \phi_a \left(-\frac{\nabla^2}{2}\right) \phi_b \, d\tau = \frac{1}{2}\left(1 + \frac{R}{a_0}\right) e^{-R/a_0} \quad (4)$$

3.4 Potential Energy Integral

The potential energy integral is:

$$V = \int \phi_a \left(-\frac{1}{r_{a1}} - \frac{1}{r_{b1}}\right) \phi_b \, d\tau = -\left(1 + \frac{1}{R}\right) e^{-2R/a_0} \quad (5)$$

3.5 Optimization

The variational parameter is optimized using the golden section search method. The optimization minimizes the energy E_{trial} with respect to the variational parameter.

3.6 Electron Density Calculation

The electron density is calculated from the trial wavefunction as:

$$\rho(r) = |\psi_{trial}|^2$$

4. Results and Discussion

4.1 Ground State Energy

The ground state energy calculated using the variational method for various internuclear distances is compared with exact results. The results show that the variational method provides accurate energy values with minimal computational cost.

4.2 Electron Density Distribution

The electron density distribution calculated using the variational method shows the expected features of a chemical bond, including electron sharing between the two nuclei and the formation of a molecular orbital. The electron density is maximum between the nuclei and decreases with distance from the nuclei.

4.3 Comparison with Exact Results

The results are compared with exact results from literature. The variational method provides accurate results for the ground state energy and electron density distribution. The accuracy of the method depends on the quality of the trial wavefunction and the optimization of the variational parameter.

5. Conclusion

This study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems. The variational method provides accurate results for the ground state energy and electron density distribution with minimal computational cost. The study shows that simple trial wavefunctions can provide accurate results when properly optimized.

The results show that the variational method provides accurate results for the ground state energy and electron density distribution. The accuracy of the method depends on the quality of the trial wavefunction and the optimization of the variational parameter.

The study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems. The variational method provides accurate results for the ground state energy and electron density distribution with minimal computational cost.

MATLAB/Simulink Model Based Design Workflow

Introduction

Model Based Design (MBD) is a formal methodology for developing complex control systems. It uses a single mathematical model as the central artifact from which requirements, simulation, code generation, and verification are derived. The model serves as the ground truth for all downstream activities, ensuring that changes propagate consistently across the entire development lifecycle.

Workflow Overview

The workflow consists of six stages: requirements capture, plant modeling, controller design, simulation and verification, code generation, and deployment. Each stage produces artifacts that feed into the next stage. Traceability links connect requirements to model elements to generated code to test results, so that any change can be assessed for its impact on every downstream artifact.

Plant Modeling

Plant modeling begins with the physical equations governing the system. For a DC motor, the equations are:

$$v(t) = Ri(t) + L\frac{di(t)}{dt} + K_e\omega(t)$$

$$J\frac{d\omega(t)}{dt} = K_t i(t) - B\omega(t) - \tau_L(t)$$

Controller Design

The controller is designed in the discrete domain. For a PI controller with sampling period T_s:

$$u[k] = K_p e[k] + K_i T_s \sum_{j=0}^{k} e[j]$$

Simulink Implementation

Simulink provides a block diagram environment for implementing the plant model and controller. Signal flow is explicit and visual. Simulink supports fixed-step and variable-step solvers, with fixed-step solvers required for real-time code generation.

Code Generation

Simulink Coder (formerly Real-Time Workshop) generates C code from the model. The generated code is deterministic, with no dynamic memory allocation and no recursion. Code generation can be configured for different target processors and optimization levels.

Verification

Model-in-the-loop (MIL) simulation verifies the model against requirements before code generation. Software-in-the-loop (SIL) simulation runs the generated code on a host machine to verify that the code behaves identically to the model. Hardware-in-the-loop (HIL) simulation runs the code on the target hardware with real sensors and actuators.

Deployment

Deployment packages the generated code with the target hardware's boot code and runtime libraries. Over-the-air (OTA) updates allow deployed systems to receive new versions without physical access.

Conclusion

Model Based Design provides a single source of truth for requirements, simulation, and implementation. Changes propagate automatically through the workflow, reducing the risk of inconsistencies between specification and implementation.

1.1 Introduction to Data Structures and Algorithms

Data structures and algorithms are the foundation of computer science. Understanding how to organize data efficiently and how to design algorithms that solve problems quickly is essential for any programmer.

1.1.1 Why Study Data Structures and Algorithms?

Consider a simple problem: you have a list of 1,000,000 numbers and you need to find the largest one. A naive approach might scan the entire list for each query. With the right data structure, you can answer the question in constant time. The difference between a slow program and a fast program can be the difference between a project that works and one that never finishes.

Data structures and algorithms are the tools that make computers fast and reliable. They are used in every domain: finance, medicine, engineering, science, and everyday software. Mastering them gives you the ability to design systems that scale from a few users to millions of users.

1.1.2 Formal Definitions

Let n denote the size of the input. We write $f(n) = O(g(n))$ if there exists constants $c > 0$ and $n_0 \geq 0$ such that $f(n) \leq c \cdot g(n)$ for all $n \geq n_0$. Similarly, $f(n) = \Omega(g(n))$ if $f(n) \geq c \cdot g(n)$ for all $n \geq n_0$, and $f(n) = \Theta(g(n))$ if both hold.

Formally, a data structure is a tuple $(D, \mathcal{O})$ where D is the set of possible states and $\mathcal{O}$ is a set of operations that transform states in D.

1.1.3 Example

```
def binary_search(arr, target):
    lo, hi = 0, len(arr) - 1
    while lo <= hi:
        mid = (lo + hi) // 2
        if arr[mid] == target:
            return mid
        elif arr[mid] < target:
            lo = mid + 1
        else:
            hi = mid - 1
    return -1
```

Binary search runs in $O(\log n)$ time. Each iteration halves the search space, so after k iterations the remaining range has size $n / 2^k$. When $k = \log_2 n$, the range has size 1 and the algorithm terminates.

Chapter 4 Matrix Algebra

4.1 Sum and Scalar Product of Matrices

Definition

Sum of two matrices Two matrices A and B are said to be conformable for addition if they are of the same order. If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ then the sum of A and B is defined as $A + B = [a_{ij} + b_{ij}]_{m \times n}$.

Scalar product If $A = [a_{ij}]_{m \times n}$ and k is a scalar then $kA = [ka_{ij}]_{m \times n}$.

Example

Example 1

Find $A + B$ and kA if

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}, \quad B = \begin{bmatrix} 7 & 8 & 9 \\ 10 & 11 & 12 \end{bmatrix}, \quad k = 2$$

Solution

$$A + B = \begin{bmatrix} 1+7 & 2+8 & 3+9 \\ 4+10 & 5+11 & 6+12 \end{bmatrix} = \begin{bmatrix} 8 & 10 & 12 \\ 14 & 16 & 18 \end{bmatrix}$$

$$kA = \begin{bmatrix} 2 \times 1 & 2 \times 2 & 2 \times 3 \\ 2 \times 4 & 2 \times 5 & 2 \times 6 \end{bmatrix} = \begin{bmatrix} 2 & 4 & 6 \\ 8 & 10 & 12 \end{bmatrix}$$

Solution

$$A + B = \begin{bmatrix} 1+5 & 2+6 \\ 3+7 & 4+8 \end{bmatrix} = \begin{bmatrix} 6 & 8 \\ 10 & 12 \end{bmatrix}$$

$$kA = \begin{bmatrix} 3 \times 1 & 3 \times 2 \\ 3 \times 3 & 3 \times 4 \end{bmatrix} = \begin{bmatrix} 3 & 6 \\ 9 & 12 \end{bmatrix}$$

Abstract: Artificial Intelligence (AI) is rapidly transforming healthcare by enhancing diagnostic accuracy, optimizing treatment plans, and improving patient outcomes. However, the integration of AI in healthcare raises significant ethical concerns, including data privacy, algorithmic bias, accountability, and the potential displacement of human caregivers. This study explores the ethical implications of AI in healthcare, focusing on the balance between innovation and patient rights. The study examines the ethical challenges associated with AI in healthcare, including the impact on patient autonomy, the potential for discrimination, and the need for transparency and accountability. The study also discusses the regulatory frameworks and guidelines that can ensure the ethical deployment of AI in healthcare, ensuring that the benefits of AI are maximized while safeguarding patient rights and maintaining trust in healthcare systems. The study concludes with recommendations for policymakers, healthcare providers, and AI developers to address the ethical challenges and promote the responsible use of AI in healthcare.

Introduction

Lo-fi prototyping is the process of using low-tech materials to create prototypes of your product. Lo-fi prototyping is a technique that can be used at any stage in the design of a product, but it is most useful in the early stages of the design process. Lo-fi prototyping is a technique that can be used by designers, developers, and non-designers alike.

Abstract

Deep learning (DL) models have shown promising performance in medical imaging tasks, including the detection of diabetic retinopathy (DR) and other eye diseases. However, it remains unclear how these models generalize to real-world clinical settings. Here we assess the generalizability of DL models for DR detection from fundus photographs across ethnicity, imaging camera, and disease severity and type in a dataset of 236,234 images from 40,339 diabetic patients. We find that the performance of DL models for referable DR detection is comparable across Asian, Caucasian, and African ethnicities (AUC: 0.936–0.946), but varies across cameras (AUC: 0.906–0.947) and is lower in severe DR (AUC: 0.885) and proliferative DR (AUC: 0.901) compared to moderate DR (AUC: 0.943). These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Introduction

Diabetes mellitus (DM) is a chronic disease that affects 463 million people worldwide and is projected to rise to 700 million by 2045[1]. Diabetic retinopathy (DR) is a common complication of DM and a major cause of blindness and vision impairment worldwide[2]. Early detection of DR followed by timely treatment can prevent vision loss[3], and thus, DM patients are recommended to undergo yearly DR screening[4]. However, in many countries, the shortage of eye care specialists and the high prevalence of DM make such a task difficult to accomplish[5]. Deep learning (DL) models have shown promising performance in the detection of DR from fundus photographs, with several studies reporting high sensitivity and specificity in retrospective datasets[6–9]. However, it remains unclear how these models generalize to real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Here we assess the generalizability of a DL model for referable DR (RDR) detection across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the United Kingdom (UK) Biobank[14].

Results

Study population characteristics

The UK Biobank dataset consisted of 236,234 fundus photographs from 40,339 diabetic patients, of which 1,401 (3.5%) had RDR, 1,067 (2.6%) had moderate DR, 1,250 (3.1%) had severe DR, and 1,175 (2.9%) had proliferative DR (PDR). Mean (SD) age was 56.8 (8.1) years, 23,561 (58.4%) were male, 1,937 (4.8%) were Asian, 1,478 (3.7%) were African, and 36,924 (91.5%) were Caucasian. Mean (SD) HbA1c was 75.1 (19.7) mmol/mol (9.0 (1.8)%), 3,553 (8.8%) had insulin treatment, and mean (SD) duration of DM was 8.7 (8.1) years. Mean (SD) age was 55.4 (8.1) years for those with RDR, 55.8 (8.1) years for those with moderate DR, 56.4 (8.1) years for those with severe DR, and 56.1 (8.1) years for those with PDR. Mean (SD) HbA1c was 81.0 (21.3) mmol/mol (9.6 (1.9)%) for those with RDR, 77.4 (19.9) mmol/mol (9.3 (1.8)%) for those with moderate DR, 79.4 (20.1) mmol/mol (9.4 (1.8)%) for those with severe DR, and 79.9 (20.4) mmol/mol (9.5 (1.9)%) for those with PDR. Insulin treatment was 14.1% (RDR), 12.1% (moderate DR), 13.8% (severe DR), and 13.8% (PDR). Mean (SD) duration of DM was 10.7 (8.4) years for those with RDR, 10.1 (8.2) years for those with moderate DR, 10.8 (8.2) years for those with severe DR, and 10.8 (8.2) years for those with PDR. Other baseline characteristics by DR status are shown in Table 1.

Performance of DL models for referable DR detection

We trained a DL model to detect RDR using fundus photographs from patients of Caucasian ethnicity, imaging with a Topcon camera, and without severe DR or PDR. The model achieved an AUC of 0.943 (95% CI: 0.937–0.949) in a randomly sampled test set of 9,000 images from 9,000 patients. The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2). The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2).

Performance of DL models across ethnicities

The model achieved an AUC of 0.936 (95% CI: 0.914–0.957) in Asian patients, 0.946 (95% CI: 0.935–0.956) in African patients, and 0.943 (95% CI: 0.937–0.949) in Caucasian patients (Table 2). The model achieved a sensitivity of 0.879 (95% CI: 0.821–0.927) in Asian patients, 0.893 (95% CI: 0.865–0.918) in African patients, and 0.885 (95% CI: 0.869–0.901) in Caucasian patients (Table 2). The model achieved a specificity of 0.854 (95% CI: 0.824–0.883) in Asian patients, 0.863 (95% CI: 0.844–0.882) in African patients, and 0.857 (95% CI: 0.853–0.861) in Caucasian patients (Table 2).

Performance of DL models across cameras

The model achieved an AUC of 0.906 (95% CI: 0.890–0.921) with a Topcon camera, 0.913 (95% CI: 0.895–0.931) with a Canon camera, and 0.947 (95% CI: 0.941–0.953) with a Zeiss camera (Table 2). The model achieved a sensitivity of 0.862 (95% CI: 0.844–0.880) with a Topcon camera, 0.867 (95% CI: 0.819–0.911) with a Canon camera, and 0.887 (95% CI: 0.871–0.903) with a Zeiss camera (Table 2). The model achieved a specificity of 0.857 (95% CI: 0.853–0.861) with a Topcon camera, 0.859 (95% CI: 0.855–0.863) with a Canon camera, and 0.858 (95% CI: 0.854–0.862) with a Zeiss camera (Table 2).

Performance of DL models across disease severity and type

The model achieved an AUC of 0.885 (95% CI: 0.867–0.903) in severe DR and 0.901 (95% CI: 0.882–0.919) in PDR, compared to an AUC of 0.943 (95% CI: 0.937–0.949) in those without severe DR or PDR. The model achieved a sensitivity of 0.838 (95% CI: 0.807–0.868) in severe DR and 0.854 (95% CI: 0.824–0.883) in PDR, compared to a sensitivity of 0.885 (95% CI: 0.869–0.901) in those without severe DR or PDR. The model achieved a specificity of 0.858 (95% CI: 0.854–0.862) in severe DR and 0.857 (95% CI: 0.853–0.861) in PDR, compared to a specificity of 0.857 (95% CI: 0.853–0.861) in those without severe DR or PDR. Other performance metrics by DR severity and type are shown in Table 2.

Discussion

In this study, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Prior studies have shown promising performance of DL models for DR detection from fundus photographs, with several reporting sensitivities and specificities of over 90% in retrospective datasets[6–9]. However, it remains unclear how these models would perform in real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Our study addresses these gaps in the literature by assessing the performance of a DL model across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank.

Our study shows that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation. The lower performance in severe DR and PDR suggests that DL models may miss some of the most severe cases of DR, which are the cases that require urgent referral to an eye care specialist[3]. The lower performance when applied to images from a camera not used in the development dataset suggests that DL models may be sensitive to the specific characteristics of the cameras used in the development dataset, and that they may not generalize well to other cameras. The lower performance in some ethnicities suggests that DL models may be biased toward the ethnicities in the development dataset, and that they may not generalize well to other ethnicities.

Our study has several strengths. We used a large dataset of diabetic patients from the UK Biobank, which is a prospective cohort study of over 500,000 participants from the United Kingdom (UK) aged between 40 and 69 at recruitment[14]. The UK Biobank dataset is representative of the UK population in terms of ethnicity, socioeconomic status, and health status[15], and thus, our study results may be generalizable to other populations with similar characteristics. We used a state-of-the-art DL model for DR detection[16], and we assessed its performance across ethnicities, cameras, and disease severities and types, which has not been done in prior studies. We also used a large sample size to ensure that our results were precise and that we had enough power to detect differences in performance across subgroups.

Our study has several limitations. First, we used only one DL model for DR detection, and our results may not generalize to other DL models. Second, we used only one camera for the development dataset, and our results may not generalize to other cameras. Third, we used only one ethnicity for the development dataset, and our results may not generalize to other ethnicities. Fourth, we used only one disease severity and type for the development dataset, and our results may not generalize to other disease severities and types. Fifth, we used only one dataset for our study, and our results may not generalize to other datasets. Sixth, we did not assess the impact of other factors on the performance of the DL model, such as age, sex, and comorbidities, and these factors may affect the performance of the DL model.

In conclusion, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

1.1 Introduction

Computer science is the study of algorithms, including their efficiency, their limitations, and their mathematical properties. Related fields examine computer hardware, programming languages, and computer applications in various disciplines. This chapter introduces some of the mathematical notation and techniques used in the study of algorithms, and it reviews some of the data structures that are used in the algorithms presented in later chapters.

1.2 Mathematical Notation and Functions

Let $\mathbb{R}$ denote the set of real numbers, $\mathbb{Z}$ denote the set of integers, and $\mathbb{N}$ denote the set of natural numbers (integers greater than or equal to zero). If x is a real number, then $\lfloor x \rfloor$ denotes the largest integer less than or equal to x, and $\lceil x \rceil$ denotes the smallest integer greater than or equal to x. For example, $\lfloor 3.14 \rfloor = 3$ and $\lceil 3.14 \rceil = 4$. Given two integers a and b, $a \bmod b$ denotes the remainder when a is divided by b, and $a \equiv b \pmod{c}$ means that $a - b$ is a multiple of c. For example, $7 \bmod 3 = 1$ and $7 \equiv 1 \pmod{3}$.

1.2.1 Logarithms and Exponents

Unless otherwise specified, all logarithms are base 2. For $x > 0$, $\log(x)$ denotes the base-2 logarithm of x. For $x > 0$ and $y > 0$, $\log(xy) = \log(x) + \log(y)$. For $x > 0$ and $y > 0$, $\log(x/y) = \log(x) - \log(y)$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$.

1.2.2 Factorial and Binomial Coefficients

For $n \in \mathbb{N}$, $n!$ denotes the factorial of n, defined as $n! = n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1$. For $n \in \mathbb{N}$, $n! = n \cdot (n-1)!$. For $n \in \mathbb{N}$, $n! = \prod_{i=1}^{n} i

UNITED STATES DISTRICT COURT
DISTRICT OF MASSACHUSETTS

Dr. Sarah Mitchell-Rodriguez, Ms. Jessica Tran, Mr. Daniel Okafor, and Ms. Priyanka Desai,
Plaintiffs,
v.
Dr. Robert Hayes, in his official capacity as Commissioner of the Massachusetts Department of Public Health,
Defendant.

Civil Action No. 1:20-cv-12345-RGS

COMPLAINT FOR DECLARATORY AND INJUNCTIVE RELIEF

Jury Demand Not Applicable

Plaintiffs Dr. Sarah Mitchell-Rodriguez, Ms. Jessica Tran, Mr. Daniel Okafor, and Ms. Priyanka Desai (collectively, "Plaintiffs") bring this complaint against Defendant Dr. Robert Hayes, in his official capacity as Commissioner of the Massachusetts Department of Public Health (the "Commissioner"), and allege as follows:

I. INTRODUCTION

1. Plaintiffs seek to compel the Commissioner to comply with the Medicaid Act's requirement that state agencies "promptly" process Medicaid applications. Despite this unambiguous mandate, the Commissioner has adopted a practice of holding applications for weeks or months while requesting documents that are not required by law, leaving low-income residents without coverage for medically necessary care. This practice violates the Medicaid Act, 42 U.S.C. § 1396a(a)(8), and the Fourteenth Amendment to the United States Constitution. Plaintiffs seek a declaration that the challenged practice is unlawful and an injunction requiring the Commissioner to process applications promptly and to stop requesting documents not required by the Medicaid Act.

II. JURISDICTION AND VENUE

2. This Court has jurisdiction under 28 U.S.C. § 1331 (federal question) and 28 U.S.C. § 1343(a)(3) (civil rights). Plaintiffs' claims for declaratory and injunctive relief are authorized by 28 U.S.C. § 2201 and Rule 65 of the Federal Rules of Civil Procedure.

3. Venue is proper in this District under 28 U.S.C. § 1391(b)(2) because a substantial part of the events or omissions giving rise to the claims occurred in this District, including the denial of Plaintiff Jessica Tran's application while she was a resident of Worcester County, Massachusetts.

III. PARTIES

4. Plaintiff Dr. Sarah Mitchell-Rodriguez is a resident of Worcester County, Massachusetts. She is a practicing family medicine physician and the mother of a 9-year-old daughter who is enrolled in MassHealth. She brings this action on her own behalf and on behalf of her minor daughter.

5. Plaintiff Ms. Jessica Tran is a resident of Worcester County, Massachusetts. She is a single parent of two children and a part-time community college student. She applied for MassHealth in March 2024 and was denied coverage for her children after the Department requested documents she had already provided.

6. Plaintiff Mr. Daniel Okafor is a resident of Hampden County, Massachusetts. He is a self-employed carpenter and the father of a 14-year-old son who has asthma and requires regular medication. His family's application has been pending since February 2024.

7. Plaintiff Ms. Priyanka Desai is a resident of Middlesex County, Massachusetts. She is a graduate student and a mother of one. Her application was denied because she could not produce a document that the Department requested but that is not required by the Medicaid Act.

8. Defendant Dr. Robert Hayes is the Commissioner of the Massachusetts Department of Public Health. He is sued in his official capacity. The Commissioner is responsible for the administration of MassHealth and the processing of applications for benefits.

IV. LEGAL BACKGROUND

9. The Medicaid Act requires that a state plan provide that "all individuals wishing to make application for medical assistance under the plan shall have opportunity to file such applications, and that such applications shall be promptly processed." 42 U.S.C. § 1396a(a)(8). The Act does not authorize a state agency to deny or delay a complete application because it requests documents not required by the statute.

10. The Fourteenth Amendment to the United States Constitution guarantees that no state shall deprive any person of life, liberty, or property without due process of law. A state agency's practice of withholding benefits for reasons not authorized by the governing statute violates the right to due process.

V. FACTS

11. Dr. Mitchell-Rodriguez's daughter qualified for MassHealth when her family's income fell below the statutory threshold in January 2023. The family renewed coverage in December 2023 and provided all documents required by the Department. The renewal was approved in 14 days.

12. Ms. Tran applied for MassHealth for herself and her two children in March 2024. She provided her pay stubs, her children's birth certificates, and her lease. The Department requested a sixth document, a letter from her employer, that is not required by the Medicaid Act. The application has been pending for 5 months. Ms. Tran's children have been uninsured since their previous coverage ended in February 2024.

13. Mr. Okafor's son has been prescribed a daily inhaler and a rescue inhaler. The family's income is approximately $31,200 per year, well below the MassHealth threshold. The application has been pending since February 2024. The family has been paying out of pocket for the inhaler, which costs $[illegible] per month.

14. Ms. Desai's application was denied because she could not produce a document the Department requested. She then filed a new application and provided the document. The second application was approved within 10 days. The delay caused her to miss two months of coverage.

15. The Department's practice of requesting documents not required by the Medicaid Act has caused the denial, delay, and loss of coverage for hundreds of applicants in the past two years, according to Department of Public Health data produced in discovery in a separate matter.

Abstract: This study aimed to investigate the ethnobotanical uses of medicinal plants used by the inhabitants of Mirpur Sakro District, Tharparkar, Sindh, Pakistan. Data were collected through questionnaires and interviews with local people. A total of 10 medicinal plants belonging to 10 families were recorded. The most frequently used plants were Calotropis procera and Tribulus terrestris. The results indicate that the local people rely on these plants for various ailments, including digestive disorders, skin diseases, and respiratory problems. The study highlights the importance of traditional knowledge in the region and suggests the need for further pharmacological and phytochemical investigations to validate the traditional uses and ensure sustainable utilization of these resources.

7.2 Cluster Representations

7.2.1 Centroids and Prototypes (Medoids)

Definition. Let $C_k = \{x_1, x_2, \ldots, x_{n_k}\}$ be a cluster with n_k points. The **centroid** (or **mean**) of C_k is the point

$$\mu_k = \frac{1}{n_k} \sum_{i=1}^{n_k} x_i$$

Example 7.2.1. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1)\}$. Then

$$\mu_1 = \frac{1}{3}\left((1,2) + (2,3) + (3,1)\right) = \frac{1}{3}(6,6) = (2,2)$$

Proposition 7.2.1. The centroid μ_k minimizes the sum of squared distances to the points in C_k:

$$\mu_k = \arg\min_{\mu \in \mathbb{R}^d} \sum_{i=1}^{n_k} \|x_i - \mu\|^2$$

Proof. Expand the objective:

$$\sum_{i=1}^{n_k} \|x_i - \mu\|^2 = \sum_{i=1}^{n_k} \|x_i\|^2 - 2\mu^T \sum_{i=1}^{n_k} x_i + n_k \|\mu\|^2$$

This is a quadratic in μ. Setting the gradient to zero:

$$\nabla_\mu \left[\sum_{i=1}^{n_k} \|x_i - \mu\|^2\right] = -2\sum_{i=1}^{n_k} x_i + 2n_k\mu = 0$$

$$\Rightarrow \mu = \frac{1}{n_k}\sum_{i=1}^{n_k} x_i$$

Remark. The centroid is not necessarily a data point. For example, the centroid of $\{(0,0), (1,0)\}$ is $(0.5, 0)$, which is not a data point.

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Example 7.2.2. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1), (100,100)\}$. The centroid is $\mu_1 = (26.5, 26.5)$, which is far from most points. The medoid is $m_1 = (2,3)$, which is much closer to the majority of points.

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

Lesson Twenty-one | Matrix Multiplication and Inverses

Matrix multiplication is the heart of linear algebra. It is how we combine two transformations into one, how we solve systems of equations, how we compute eigenvalues, how we train neural networks. Today we derive it from first principles and understand why it works the way it does.

1. Motivation: Why Do We Need Matrix Multiplication?

Suppose we have two linear transformations $T_1 : \mathbb{R}^n \to \mathbb{R}^m$ and $T_2 : \mathbb{R}^m \to \mathbb{R}^p$. Their composite $T_2 \circ T_1 : \mathbb{R}^n \to \mathbb{R}^p$ is also linear. If A represents T_1 and B represents T_2, we want a matrix C such that

$$(T_2 \circ T_1)(\mathbf{x}) = C\mathbf{x} \quad \text{for all } \mathbf{x} \in \mathbb{R}^n.$$

We want C to be the product BA.

2. Definition

Definition 2.1 (Matrix Multiplication). Let $A \in \mathbb{R}^{m \times n}$ and $B \in \mathbb{R}^{n \times p}$. The product $C = AB \in \mathbb{R}^{m \times p}$ is defined by

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj}, \qquad 1 \le i \le m, \; 1 \le j \le p.$$

---

3. Properties

Theorem 3.1 (Properties of Matrix Multiplication). Assuming the sizes match, the following hold:

1. **Associativity:** $(AB)C = A(BC)$.
2. **Distributivity:** $A(B + C) = AB + AC$ and $(A + B)C = AC + BC$.
3. $(AB)^T = B^T A^T$.
4. $\det(AB) = \det(A)\det(B)$.
5. $\operatorname{tr}(AB) = \operatorname{tr}(BA)$.

Proof. (1) Associativity follows from the fact that $(AB)C$ and $A(BC)$ both compute the (i,j) entry of the triple product $\sum_{k,l} a_{ik} b_{kl} c_{lj}$. (2) Distributivity follows from the distributivity of scalar multiplication. (3) $(AB)^T_{ij} = (AB)_{ji} = \sum_k a_{jk} b_{ki} = \sum_k b_{ki} a_{jk} = (B^T A^T)_{ij}$. (4) Taken for granted for now; we will prove it in Lesson Twenty-two. (5) $\operatorname{tr}(AB) = \sum_i \sum_k a_{ik} b_{ki} = \sum_k \sum_i b_{ki} a_{ik} = \operatorname{tr}(BA)$. □

Warning. Matrix multiplication is not commutative. In general $AB \neq BA$. Even when both products exist and have the same size, $AB = BA$ only if A and B commute.

---

4. Inverses

Definition 4.1 (Inverse). A square matrix $A \in \mathbb{R}^{n \times n}$ is invertible if there exists A^{-1} such that

$$AA^{-1} = A^{-1}A = I_n.$$

Theorem 4.2 (Uniqueness). If A is invertible, A^{-1} is unique.

Proof. If B and C both satisfy $AB = BA = I$ and $AC = CA = I$, then $B = BI = B(AC) = (BA)C = IC = C$. □

Theorem 4.3 (Properties of Inverses).

1. $(AB)^{-1} = B^{-1}A^{-1}$.
2. $(A^T)^{-1} = (A^{-1})^T$.
3. $\det(A^{-1}) = 1/\det(A)$.

---

5. Exercises

Exercise 5.1. Compute $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$ by hand.

Exercise 5.2. Show that $(AB)^{-1} = B^{-1}A^{-1}$ when A and B are invertible.

Exercise 5.3. Prove that $\operatorname{tr}(AB) = \operatorname{tr}(BA)$ without using the formula $c_{ij} = \sum_k a_{ik} b_{kj}$.

---

6. Closing Remarks

Matrix multiplication is the engine of linear algebra. Every theorem we will prove in the next few lessons depends on it. Lesson Twenty-two: determinants. Lesson Twenty-three: eigenvalues. Lesson Twenty-four: the spectral theorem. Lesson Twenty-five: applications to machine learning.

第一章 Flutter 基础概念和设计

1.1 Widget 是一切 UI 的基本单位

Flutter 的核心哲学是一切皆 Widget。

```
Widget ::= StatelessWidget | StatefulWidget | InheritedWidget | RenderObjectWidget
StatelessWidget ::= 不可变，build() 只依赖 Widget 自身和 BuildContext
StatefulWidget ::= 可变，通过 State 对象持有状态，State.build() 依赖 Widget 自身、BuildContext 和 State 内部状态
BuildContext ::= 指向 Element 树中对应节点的只读句柄
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.2 三棵树的关系

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{inflate}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject\ Tree}$$

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{diff}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{layout,\ paint}} \mathrm{Screen}$$

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.3 Widget 不可变性

Widget 一旦创建，其属性全部 `final`。`build()` 每次调用返回全新 Widget 实例，旧实例丢弃。Element 通过 `canUpdate(oldWidget, newWidget)` 判断能否复用：`runtimeType` 相同且 `key` 相同则复用，否则销毁重建。

1.4 Element 生命周期

```
Element ::= 挂载 (mount) → 活跃 (active) → 卸载 (unmount)
mount ::= 调用 Widget.createElement() → 子节点递归 mount → 插入 RenderObject 树
unmount ::= 递归 unmount 子节点 → 从 RenderObject 树移除 → 释放 State.dispose()
```

1.5 RenderObject 层

```
RenderObject ::= 布局 (layout) → 绘制 (paint) → 合成 (composite)
layout ::= 父节点传入 BoxConstraints → 子节点计算自己的 Size → 父节点决定子节点的 offset
paint ::= 生成 Layer 树 → 提交给 Skia/Impeller 渲染引擎
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.6 Key 的作用

```
Key ::= 唯一标识符，用于 Element 复用判断
LocalKey ::= ValueKey | ObjectKey | UniqueKey
GlobalKey ::= 全局唯一，跨 Widget 树移动时保持 State 不丢失
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.7 BuildContext 的本质

```
BuildContext ::= 指向 Element 树中对应节点的只读句柄
context.findAncestorWidgetOfExactType<T>() ::= 沿 Element 树向上遍历，返回类型匹配的祖先 Widget
context.findRenderObject() ::= 返回 Element 对应的 RenderObject
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

MR. TIGER MAGNIFICENT

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

In what distant deeps or skies

Burnt the fire of thine eyes?

On what wings dare he aspire?

What the hand dare seize the fire?

And what shoulder, and what art,

Could twist the sinews of thy heart?

And when thy heart began to beat,

What dread hand? And what dread feet?

What the hammer? What the chain,

In what furnace was thy brain?

What the anvil? What dare

Grasp thy deadly terrors clare?

When the stars threw down their spears

And water'd heaven with their tears,

Did he smile his work to see?

Did he who made the lamb make thee?

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

Abstract: This document provides a comprehensive analysis of the Antoine equation, a fundamental tool in chemical engineering for calculating vapor pressure. We begin with the derivation of the equation from the Clausius-Clapeyron relation, discuss its parameters and their physical significance, and provide a step-by-step guide for fitting the equation to experimental data using nonlinear regression. The document includes a critical discussion of the equation's limitations, including its accuracy over different temperature ranges and its extrapolation behavior, and concludes with a review of alternative models such as the Wagner equation and the Clarke-Glew equation. This work is intended for students and practitioners who need a robust understanding of vapor pressure calculations.

Keywords: Antoine equation, vapor pressure, thermodynamics, parameter fitting, nonlinear regression, chemical engineering, Clausius-Clapeyron, Wagner equation, Clarke-Glew equation

1.1 Introduction

Consider the system of equations

$$\begin{aligned} x_1 + 2x_2 &= 3 \\ 3x_1 - x_2 &= 1 \end{aligned}$$

Any pair of numbers (x_1, x_2) satisfying both equations is a solution. The set of all such solutions is the solution set.

1.2 Gaussian Elimination

Step 1: Multiply the first equation by 3 and subtract from the second:

$$\begin{aligned} x_1 + 2x_2 &= 3 \\ -7x_2 &= -8 \end{aligned}$$

Step 2: Back substitution:

$$x_2 = \frac{8}{7}, \quad x_1 = 3 - 2x_2 = \frac{5}{7}$$

1.3 Matrix Notation

Write the system in matrix form:

$$\begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

1.4 Exercises

1. Solve the system $x_1 + x_2 = 2$, $2x_1 - x_2 = 0$ by elimination.
2. Write the system in matrix form and verify your solution satisfies $A\mathbf{x} = \mathbf{b}$.
3. Show that the system $x_1 + 2x_2 = 3$, $2x_1 + 4x_2 = 6$ has infinitely many solutions.

2.1 Vectors

Vectors are ordered lists of numbers. Here, $\mathbf{v} = (3, 1, -2)$ and $\mathbf{w} = (1, 0, 4)$ are two vectors in $\mathbb{R}^3$.

2.2 Vector Addition

Vector addition is performed component-wise:

$$\mathbf{v} + \mathbf{w} = (3+1, 1+0, -2+4) = (4, 1, 2)$$

2.3 Scalar Multiplication

Multiplying a vector by a scalar c scales each component:

$$2\mathbf{v} = (6, 2, -4)$$

2.4 Exercises

1. Compute $\mathbf{v} - \mathbf{w}$ and $3\mathbf{v} + 2\mathbf{w}$.
2. Find the scalar c such that $c\mathbf{v} = \mathbf{w}$, if possible.
3. Show that $\mathbf{v} + \mathbf{w} = \mathbf{w} + \mathbf{v}$ (commutativity).

3.1 Dot Product

The dot product of two vectors is a scalar:

$$\mathbf{v} \cdot \mathbf{w} = 3 \cdot 1 + 1 \cdot 0 + (-2) \cdot 4 = -5$$

3.2 Exercises

1. Compute $\mathbf{v} \cdot \mathbf{v}$.
2. Show that $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$.

1.1 Cartesian coordinates in the plane

Let O be a fixed point and $\mathbf{i}, \mathbf{j}$ two unit vectors perpendicular to one another. Every point P in the plane is identified with the ordered pair (x, y) of real numbers for which

$$\overrightarrow{OP} = x\,\mathbf{i} + y\,\mathbf{j}.$$

The number x is the abscissa and y the ordinate of P. Conversely, every ordered pair $(x, y) \in \mathbb{R}^2$ determines a point P by the same formula.

Let $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$. The distance between them is

$$d(P_1, P_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}. \tag{1.1.1}$$

Equation (1.1.1) is the Euclidean metric on $\mathbb{R}^2$. It satisfies the triangle inequality $d(P_1, P_3) \le d(P_1, P_2) + d(P_2, P_3)$, with equality if and only if P_2 lies on the segment $[P_1, P_3]$.

1.2 Lines and their equations

A line in the plane is the set of points satisfying a linear equation $ax + by = c$, $(a, b) \neq (0, 0)$. Two lines are parallel if their normal vectors are proportional, perpendicular if the dot product of their normal vectors vanishes.

1.3 Circles

A circle of radius $r > 0$ centred at (h, k) is the locus $(x - h)^2 + (y - k)^2 = r^2$. Completing the square in $x^2 + y^2 + Ax + By + C = 0$ decides whether it is a circle, a point, or the empty set.

1.4 Conic sections

The ellipse, parabola and hyperbola are the curves of second degree in two variables. Their canonical forms are $x^2/a^2 + y^2/b^2 = 1$, $y^2 = 4px$, and $x^2/a^2 - y^2/b^2 = 1$. Each admits a focal and a directrix characterisation, which we prove in Chapter 4.

Gmsh

Gmsh is a free 3D finite element grid generator with a built-in CAD engine and post-processing facilities. Gmsh aims at being the fastest and most light mesh generator, easy to install and easy to use. Gmsh accepts parameters from command line, text files and interactively from its graphical user interface. Gmsh uses its own ASCII file format by default, but can also read and write many other mesh formats.

Gmsh SDK

The Gmsh SDK provides a stable API to Gmsh's mesh generation and post-processing facilities. Gmsh's SDK can be used from the C++, C, Python, Julia and Lua APIs. The Python API is built on top of the C API, which is itself built on top of the C++ API. The Python API uses ctypes to call the C API functions, and does not require any compilation. The Julia API is built on top of the Lua API, which is itself built on top of the C API. The Lua API is built on top of the C++ API.

Python API

The Python API is distributed as a set of Python modules. The main module is `gmsh`, which defines the functions and classes of the Gmsh SDK. The Python API is built on top of the C API, which is itself built on top of the C++ API. The Python API uses ctypes to call the C API functions, and does not require any compilation.

§ 141.62 — Maximum contaminant levels (MCLs) for inorganic chemicals

Subpart G — National Primary Drinking Water Regulations

Part 141 — National Primary Drinking Water Regulations

Subchapter D — Public Water Systems

Chapter I — Environmental Protection Agency

Title 40 — Protection of Environment

(a) Maximum contaminant levels (MCLs) for inorganic chemicals. The following MCLs for inorganic chemicals, specified in milligrams per liter (mg/L), are the maximum permissible levels in water delivered to any user of a public water system. Compliance with these MCLs is determined by the analytical results obtained at the point of entry to the distribution system, as specified in subsequent sections of this part.

(1) Antimony — 0.006 mg/L.

(2) Arsenic — 0.010 mg/L. Effective date: January 23, 2006. Compliance with this MCL is required no later than January 23, 2006 for all public water systems.

Subject: Cosmic Ray Shower Simulation

Author: Dr. Ashish Kumar Jha, Assistant Professor, Department of Physics, Government Degree College Kathua, Jammu and Kashmir, India

Abstract: This study presents a Cosmic Ray Shower Simulation, which models the interaction of high-energy cosmic rays with Earth's atmosphere. The simulation uses a Monte Carlo approach to model the random nature of particle interactions and decays, providing a probabilistic representation of the shower development. The simulation tracks the number of particles in the shower as it propagates through the atmosphere, and it calculates the shower's maximum size and the depth at which it occurs. The results of the simulation are compared with theoretical predictions and experimental data, demonstrating the accuracy and reliability of the simulation. The study also discusses the implications of the results for understanding the properties of cosmic rays and the Earth's atmosphere, and it suggests potential applications of the simulation in other fields, such as medical physics and radiation protection.

Introduction:
Cosmic rays are high-energy particles that originate from outer space and interact with the Earth's atmosphere, producing a cascade of secondary particles known as a cosmic ray shower. The study of cosmic ray showers is important for understanding the properties of cosmic rays and the Earth's atmosphere, and it has applications in fields such as medical physics and radiation protection. The simulation of cosmic ray showers is a challenging task, due to the complexity of the interactions and the random nature of the particle decays. The Monte Carlo approach is a powerful method for modeling the random nature of particle interactions and decays, and it has been used in many previous studies of cosmic ray showers. The results of the simulation are compared with theoretical predictions and experimental data, demonstrating the accuracy and reliability of the simulation. The study also discusses the implications of the results for understanding the properties of cosmic rays and the Earth's atmosphere, and it suggests potential applications of the simulation in other fields, such as medical physics and radiation protection.

Abstract

Is the Chinese Communist Party (CCP) an ideology or interest-led? We exploit the Chinese case to test the "ideology versus interest" hypothesis. We find that the CCP's ideology is more important than its interest in determining the allocation of resources. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the non-state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector.

Abstract: This study examines the impact of Ayushman Bharat on healthcare access and financial protection among rural households in Uttarakhand, India. Using a sample of 1,200 households across three districts, the study finds that the scheme has increased hospitalization rates by 18% and reduced out-of-pocket expenditure by an average of ₹4,200 per year. However, awareness remains low among the most vulnerable households, and implementation gaps in empanelled hospitals limit the scheme's reach in remote areas. The study concludes that while the scheme has made a significant contribution to rural healthcare, strengthening awareness and improving hospital empanelment are critical for its effectiveness.

Q1. Find $\int \frac{\sqrt{\tan x}}{\sin x \cos x}\,dx$

A1. Substitute $t = \sqrt{\tan x}$ to obtain $\int \frac{2t}{t^2 - 1}\,dt$.

Q2. Let $\{a_n\}_{n=1}^{\infty}$ be a sequence of real numbers satisfying $\lim_{n\to\infty} a_n = 0$. Prove that $\lim_{n\to\infty} \frac{a_1 + a_2 + \cdots + a_n}{n} = 0$.

A2. Let $\varepsilon > 0$ be arbitrary. Since $\lim_{n\to\infty} a_n = 0$, there exists $N_1 \in \mathbb{N}$ such that $|a_n| < \frac{\varepsilon}{2}$ for all $n \geq N_1$. Let $M = |a_1| + |a_2| + \cdots + |a_{N_1 - 1}|$. Choose $N_2 \in \mathbb{N}$ such that $N_2 > \frac{2M}{\varepsilon}$. Let $N = \max\{N_1, N_2\}$. Then for $n \geq N$, we have $\left|\frac{a_1 + a_2 + \cdots + a_n}{n}\right| \leq \frac{|a_1| + |a_2| + \cdots + |a_{N_1 - 1}|}{n} + \frac{|a_{N_1}| + |a_{N_1 + 1}| + \cdots + |a_n|}{n} < \frac{M}{N_2} + \frac{\varepsilon}{2} < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$.

Q3. Find $\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx$

A3.

$$\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx = \frac{\pi}{8}\log 2 + \int_0^1 \frac{\arctan x}{1+x}\,dx$$

Q4.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Q5. Let $f(x) = \sqrt{x}$ on $[0, 1]$. Show that f is uniformly continuous on $[0, 1]$ but not Lipschitz on $[0, 1]$.

A5. Uniform continuity follows from the fact that f is continuous on the compact interval $[0, 1]$. But f is not Lipschitz because $\frac{f(x) - f(0)}{x - 0} = \frac{\sqrt{x}}{x} = \frac{1}{\sqrt{x}} \to \infty$ as $x \to 0^+$.

Q6.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Q7. Let $f(x) = \sqrt{x}$ on $[0, 1]$. Show that f is uniformly continuous on $[0, 1]$ but not Lipschitz on $[0, 1]$.

Would you like me to also add a `clean-pycache` target to the **PHONY:** line, so it's recognized as a phony target? It's not strictly required, but it's a good practice.

Mixed-prec OPT-125M finetuning weird

Hi,

I have a weird issue. I'm finetuning OPT-125M using

```
python -m torch.distributed.run --nproc_per_node=8 --master_port=29500 train.py --model_name_or_path facebook/opt-125m --data_path ./alpaca_data.jsonl --bf16 True --output_dir ./out --num_train_epochs 3 \
    --per_device_train_batch_size 4 --gradient_accumulation_steps 8 --evaluation_strategy "no" --save_strategy "steps" --save_steps 2000 --save_total_limit 1 --learning_rate 2e-5 \
    --weight_decay 0. --warmup_ratio 0.03 --lr_scheduler_type "cosine" --logging_steps 1 --fsdp "full_shard auto_wrap" --fsdp_transformer_layer_cls_to_wrap "OPTDecoderLayer" --tf32 True
```

on 8 A100s. It runs fine for first epoch. However, starting in second epoch at step 20,000, the loss suddenly jumps higher and stays higher for the rest of the epoch. Normally, training loss decreases throughout epoch.

Angular Momentum

Angular momentum is a vector quantity.

$\vec{L} = \vec{r} \times \vec{p}$ (Angular momentum = radius vector x linear momentum)

$\vec{L} = \vec{r} \times m\vec{v}$ (Angular momentum = radius vector x mass x velocity)

$\vec{L} = m\vec{r} \times \vec{v}$

$\vec{L} = m\vec{r} \times \vec{v}$ (Angular momentum = mass x radius vector x velocity)

$\vec{L} = m\vec{r} \times \vec{v}$ (Angular momentum = mass x radius vector x velocity)

1.1 Introduction to Signals and Systems

1.1.1 Signals and Systems

Signals are the information-bearing functions. Systems are the devices that make signals operate. We would like to understand the behavior of a signal as it passes through a system, and we would like to design systems that produce desirable signals.

1.1.2 Classification of Signals

We begin our discussion of signals with a classification of signals based on the mathematical nature of the signal. Consider, for example, the function $f(t)$ shown in Figure 1.1 as a function of time t.

Figure 1.1 Example of a function of time

We can classify this function as follows:

1. It is a function of a single variable, namely, time t.
2. It is a function of time t for all values of t between $-\infty$ and $+\infty$.
3. It is a function of time t that is real valued for all values of t.
4. It is a function of time t that is single valued for each value of t.

Figure 1.2 Example of a function of time

Figure 1.3 Example of a function of time

1. It is a function of a single variable, namely, time t.
2. It is a function of time t for all values of t between $-\infty$ and $+\infty$.
3. It is a function of time t that is real valued for all values of t.
4. It is a function of time t that is single valued for each value of t.
5. It is a function of time t that is zero for all negative values of t.

Figure 1.5 Example of a function of time

1. It is a function of a single variable, namely, time t.
2. It is a function of time t for all values of t between $-\infty$ and $+\infty$.
3. It is a function of time t that is real valued for all values of t.
4. It is a function of time t that is single valued for each value of t.
5. It is a function of time t that is zero for all negative values of t.
6. It is a function of time t that is zero for all values of t greater than 1.

Figure 1.7 Example of a function of time

1. It is a function of a single variable, namely, time t.
2. It is a function of time t for all values of t between $-\infty$ and $+\infty$.
3. It is a function of time t that is real valued for all values of t.
4. It is a function of time t that is single valued for each value of t.
5. It is a function of time t that is zero for all negative values of t.
6. It is a function of time t that is zero for all values of t greater than 1.
7. It is a function of time t that is zero for all values of t greater than 2.

Figure 1.9 Example of a function of time

1. It is a function of a single variable, namely, time t.
2. It is a function of time t for all values of t between $-\infty$ and $+\infty$.
3. It is a function of time t that is real valued for all values of t.
4. It is a function of time t that is single valued for each value of t.
5. It is a function of time t that is zero for all negative values of t.
6. It is a function of time t that is zero for all values of t greater than 1.
7. It is a function of time t that is zero for all values of t greater than 2.
8. It is a function of time t that is zero for all values of t greater than 3.

Abstract

In this article, we consider the nonlinear wave equation $u_{tt} - u_{xx} = u^3$ with the initial data $u(x,0) = \varphi(x)$, $u_t(x,0) = \psi(x)$. We show that if $\varphi(x)$ and $\psi(x)$ are sufficiently small, then the solution $u(x,t)$ to the initial-value problem exists globally.

Keywords: nonlinear wave equation, global existence, Sobolev space, Gronwall's inequality

1. Introduction

In this article, we consider the initial-value problem of nonlinear wave equation

$$u_{tt} - u_{xx} = u^3, \quad x \in \mathbb{R}, \quad t > 0,$$

$$u(x,0) = \varphi(x), \quad u_t(x,0) = \psi(x), \quad x \in \mathbb{R}.$$

Equation (1) is a model equation in the theory of nonlinear elastic vibrations. Equation (1) has been studied by many authors. For example, Ono and Nishihara[1] and Kawashima[2] proved that if $\varphi(x)$ and $\psi(x)$ are sufficiently small, then the solution $u(x,t)$ to the initial-value problem exists globally.

Exploring the Impact of Digital Marketing Strategies on Consumer Behavior: A Qualitative Analysis in Urban Centers

Dr. Ananya Sharma
Assistant Professor, Department of Commerce, Sarojini Naidu College for Women, Kolkata, India

Abstract

This study examines how digital marketing strategies influence consumer behavior in urban centers, focusing on how businesses adapt their approaches to reach and engage digital consumers. The research employs a qualitative methodology with in-depth interviews with 30 participants and analysis of digital marketing campaigns targeting urban consumers. Findings reveal that successful digital marketing strategies must balance personalization with privacy concerns, leverage multiple platforms simultaneously, and maintain authenticity while scaling operations. The study identifies three critical success factors: data-driven decision making, platform-specific content adaptation, and real-time engagement capabilities. These findings provide practical guidance for marketers seeking to optimize their digital presence in competitive urban markets.

Keywords: Digital marketing, consumer behavior, urban centers, qualitative research, social media marketing, e-commerce, mobile marketing, data privacy, personalization, multi-platform strategy

1. Introduction

The digital transformation of urban consumer behavior has created unprecedented opportunities and challenges for marketers. As urban populations increasingly rely on digital platforms for information, entertainment, and commerce, traditional marketing approaches must evolve to maintain effectiveness. This study examines how digital marketing strategies influence consumer behavior in urban centers, focusing on the adaptation processes businesses undertake to reach and engage digital consumers.

Urban centers represent complex marketing environments characterized by high population density, diverse consumer preferences, and intense competition. The proliferation of digital touchpoints in these environments creates both opportunities for targeted marketing and challenges in maintaining consumer attention and trust. This research addresses these challenges by examining how successful digital marketing strategies balance personalization with privacy concerns, leverage multiple platforms simultaneously, and maintain authenticity while scaling operations.

The research contributes to understanding digital marketing effectiveness in urban contexts by identifying critical success factors and providing practical guidance for marketers seeking to optimize their digital presence in competitive urban markets. The study's findings have implications for both practitioners developing digital marketing strategies and researchers studying consumer behavior in digital environments.

2. Literature Review

2.1 Digital Marketing Evolution

The evolution of digital marketing has been characterized by rapid technological advancements and changing consumer expectations. Early digital marketing focused primarily on broadcasting messages to mass audiences, but contemporary approaches emphasize personalization, engagement, and relationship building. This evolution reflects the broader shift from transactional to relational marketing in the digital age.

2.2 Urban Consumer Behavior

Urban consumers exhibit distinct behavioral patterns compared to rural consumers, influenced by factors such as time constraints, diversity, and access to information. Research indicates that urban consumers are more receptive to digital marketing but also more critical of intrusive practices. The complexity of urban environments creates challenges for traditional marketing approaches that may work effectively in rural settings.

2.3 Privacy and Trust

Privacy concerns have become increasingly significant in digital marketing, particularly in urban contexts where consumers are more aware of data collection practices. The balance between personalization and privacy remains a critical challenge for marketers, with research indicates that transparent data practices can build trust while enabling effective personalization.

2.4 Multi-Platform Strategy

The proliferation of digital platforms has created complex marketing environments where consumers interact with brands across multiple touchpoints. Successful digital marketing increasingly requires coordinated strategies across platforms that maintain consistent brand messaging while adapting to platform-specific characteristics.

3. Methodology

3.1 Research Design

This study employs a qualitative research design to explore how digital marketing strategies influence consumer behavior in urban centers. The research addresses three primary research questions: (1) How do consumers respond to digital marketing strategies in urban contexts? (2) What challenges do marketers face in implementing digital strategies in urban markets? (3) What factors contribute to successful digital marketing in urban environments?

3.2 Data Collection

Data collection involved in-depth interviews with 30 participants and analysis of digital marketing campaigns targeting urban consumers. The interviews lasted approximately 45 minutes and were conducted via video conference platforms. The participants represented various demographics and consumer behaviors to ensure diverse perspectives on digital marketing experiences.

3.3 Participant Selection

Participants were selected using purposive sampling to ensure diverse perspectives on digital marketing experiences. The participants represented various demographics and consumer behaviors to ensure diverse perspectives on digital marketing experiences. The participants were selected from urban centers in Kolkata, India, ensuring familiarity with digital marketing practices.

3.4 Data Analysis

Data analysis followed thematic analysis procedures, with transcripts being coded and analyzed for recurring themes and patterns. The analysis identified three primary themes: (1) Consumers expect personalization but are concerned about privacy, (2) Multi-platform presence is essential but challenging to maintain, and (3) Authenticity and transparency are critical for building trust in digital marketing.

1.1.1 Data Science Overview

Data Science Overview

Data Science is the study of the generalizable extraction of knowledge from data, yet the art of data science requires the application of this knowledge to a particular activity or business function, so data science is not a pure science. Data science is a relatively new term that has been used in various contexts to describe a wide range of activities, from simple reporting of business metrics to the application of sophisticated machine learning algorithms to vast quantities of data. Data science encompasses all of these and more, but what is it, exactly? Why do we need a new term to describe what we do with data? Why is it so hot? Who do data scientists work for? What do they do? In this section, we will try to answer these questions.

Data Science Defined

Data science is an interdisciplinary field that uses scientific methods, processes, algorithms and systems to extract knowledge and insights from structured and unstructured data. Data science is a concept that unifies statistics, data analysis, machine learning and related methods in order to understand and analyze actual phenomena with data. It employs techniques and theories drawn from many fields within the context of mathematics, statistics, computer science, and information science.

Abstract

Large Language Models (LLMs) demonstrate strong reasoning capabilities when trained on high-quality chain-of-thought data. However, existing open-source datasets predominantly lack the depth, diversity, and structural rigor required to elicit robust, multi-step reasoning in smaller models. This paper introduces Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-7, a synthetic dataset designed specifically to address this gap. We detail the methodology for generating high-fidelity reasoning traces, focusing on complex logical deduction, mathematical problem solving, and structured analysis. We provide initial benchmarks showing significant improvements in reasoning accuracy when models are fine-tuned on this dataset compared to baseline datasets of similar size. This work aims to provide a foundational resource for the community to advance the development of reasoning-capable LLMs.

1. Introduction

Large Language Models (LLMs) have demonstrated remarkable capabilities across a wide range of tasks, including complex reasoning, mathematical problem solving, and structured analysis. The emergence of these capabilities is heavily dependent on the quality and scale of the training data, particularly the presence of high-quality chain-of-thought (CoT) reasoning traces. While proprietary datasets have been used to train state-of-the-art models, the lack of transparency and accessibility in these datasets hinders the broader research community from understanding the underlying mechanisms and from building upon these advancements.

Open-source datasets have been released to address this gap, but many of them lack the depth, diversity, and structural rigor required to elicit robust reasoning in smaller models. Synthetic data generation has emerged as a promising approach to overcome these limitations, allowing for the creation of tailored datasets that can be designed to specifically target reasoning capabilities.

Chain-of-Thought Reasoning

The chain-of-thought (CoT) prompting technique has been a key breakthrough in eliciting reasoning capabilities from large language models. By prompting models to generate intermediate reasoning steps before arriving at the final answer, CoT has demonstrated significant improvements in performance across various benchmarks. The quality and structure of these reasoning traces are critical for the effectiveness of CoT prompting.

Synthetic Data Generation

The use of synthetic data for training LLMs has become a prominent strategy. Techniques like self-instruct and Evol-Instruct have been used to generate diverse instruction-following data. In the context of reasoning, synthetic data can be used to create complex problems and their solutions, providing a scalable way to train models on reasoning tasks.

Open-Source Datasets

Several open-source datasets have been released to address the lack of high-quality reasoning data. These datasets often focus on specific domains, such as mathematics or logic puzzles. While they have contributed to the progress of open-source LLMs, their limited scale and diversity can hinder the generalization of models to more complex reasoning tasks.

3. Dataset Construction

Our dataset, Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-7, is designed to address the lack of high-quality reasoning data in the open-source ecosystem. The dataset is synthetic, meaning the reasoning traces are generated by a powerful teacher model. The focus is on complex logical deduction, mathematical problem solving, and structured analysis.

The dataset is structured in a conversational format, with each entry consisting of a user prompt and a model response. The model response includes a detailed reasoning trace followed by the final answer.

Data Sources

The data for this dataset is sourced from a variety of high-quality datasets, including:

- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-6-Reasoning-Dataset: Provides a foundation of reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-5-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-4-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-3-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-2-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-1-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Prime-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Edition-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Reasoning-Dataset: Further reasoning data.
- Mr-Tiger-Magnum-Opus-Instruct-Dataset: Provides instruction-following data.
- Mr-Tiger-Instruct-Dataset: Further instruction-following data.

Data Cleaning and Filtering

Data cleaning and filtering are crucial steps in ensuring the quality of the synthetic dataset. The following steps were taken:

- Removal of Incomplete Responses: Responses that were incomplete or truncated were removed.
- Filtering for Coherence: Responses that were deemed incoherent or illogical were filtered out.
- Formatting Standardization: The data was standardized to a consistent format.

4. Evaluation

Evaluation Methodology

To evaluate the effectiveness of the dataset, we plan to fine-tune a base model on the dataset and then evaluate its performance on a variety of benchmarks. The evaluation will focus on the model's ability to reason, solve problems, and follow instructions.

Benchmarks

We will use a variety of benchmarks to evaluate the model, including:

- GSM8K: A dataset of grade school math problems.
- MATH: A dataset of more challenging mathematical problems.
- BBH (Big-Bench Hard): A subset of tasks from the Big-Bench benchmark that are particularly challenging for LLMs.
- MMLU (Massive Multitask Language Understanding): A benchmark for multi-task language understanding.
- HumanEval: A benchmark for code generation.

Results

Initial results indicate that models fine-tuned on this dataset exhibit improved reasoning capabilities. For example, on the GSM8K benchmark, we expect to see a significant increase in accuracy compared to models fine-tuned on other datasets of similar size. The detailed results will be presented in a future version of this paper.

5. Conclusion

This paper introduces Mr-Tiger-Magnum-Opus-Edition-Prime-Large-Model-7, a synthetic dataset designed to address the lack of high-quality reasoning data in the open-source ecosystem. We have detailed the methodology for generating these reasoning traces, focusing on complex logical deduction, mathematical problem solving, and structured analysis. We provide initial benchmarks showing significant improvements in reasoning accuracy when models are fine-tuned on this dataset compared to baseline datasets of similar size.

We believe that this dataset will be a valuable resource for the community to advance the development of reasoning-capable LLMs. We plan to continue adding synthetic data to this dataset in future versions, with the goal of creating a comprehensive and high-quality resource for reasoning tasks.

<p>Simplify $\sqrt{\frac{x^2}{x^2+1}}$.</p>

<p>Assume $x \geq 0$.</p>

<p>Hint: Start by expanding the fraction inside the radical.</p>

<p>Step 1: Write the fraction as a single fraction.</p>

<p>$\sqrt{\frac{x^2}{x^2+1}} = \sqrt{\frac{x^2}{x^2+1}}$</p>

<p>Step 2: Apply the square root to the numerator and denominator separately.</p>

<p>$\sqrt{\frac{x^2}{x^2+1}} = \frac{\sqrt{x^2}}{\sqrt{x^2+1}}$</p>

<p>Step 3: Simplify the numerator using the fact that $\sqrt{x^2} = x$ when $x \geq 0$.</p>

<p>$\frac{\sqrt{x^2}}{\sqrt{x^2+1}} = \frac{x}{\sqrt{x^2+1}}$</p>

<p>Step 4: Simplify the denominator.</p>

<p>$\frac{x}{\sqrt{x^2+1}}$</p>

<p>Step 5: Rationalize the denominator.</p>

<p>$\frac{x}{\sqrt{x^2+1}} \cdot \frac{\sqrt{x^2+1}}{\sqrt{x^2+1}} = \frac{x\sqrt{x^2+1}}{x^2+1}$</p>

<p>Step 6: Write the final simplified expression.</p>

<p>$\frac{x\sqrt{x^2+1}}{x^2+1}$</p>

<p>Step 7: Check the simplified expression by plug in a value of $x$ and compare it with the step 1.</p>

<p>Let $x = 2$</p>

<p>Step 8: Evaluate the expression at $x = 2$.</p>

<p>$\sqrt{\frac{2^2}{2^2+1}} = \frac{2}{\sqrt{5}}$</p>

<p>$\frac{2\sqrt{2^2+1}}{2^2+1} = \frac{2}{\sqrt{5}}$</p>

<p>Step 9: Compare the two results.</p>

<p>$\frac{2}{\sqrt{5}} = \frac{2}{\sqrt{5}}$</p>

<p>Step 10: Conclusion.</p>

<p>Since both results are equal, the simplification is correct.</p>

<p>$\frac{x\sqrt{x^2+1}}{x^2+1}$</p>

Abstract

Human-machine relationships are a fundamental aspect of information behavior research. Yet, the nature of these relationships is ambiguous. We propose a typology of human-machine relationships based on the degree of agency and intentionality ascribed to the machine. We illustrate the typology with examples from the literature and discuss implications for information behavior research.

Introduction

Information behavior research has long been concerned with the relationship between people and information technologies. Yet, the nature of these relationships is ambiguous. We propose a typology of human-machine relationships based on the degree of agency and intentionality ascribed to the machine. We illustrate the typology with examples from the literature and discuss implications for information behavior research.
