Gnuplot is a command-line driven interactive function plotting program. Originally intended as a means to stimulate students' interest in mathematics, it has been used in scientific fields for over a decade. Gnuplot is capable of plotting 2D functions and data in various styles, and 3D functions and data in the form of surfaces and contour maps. Gnuplot can output to a variety of formats, including PostScript, PNG, and SVG.

Gnuplot is a portable command-line driven interactive data and function plotting utility for UNIX, IBM OS/2, MS Windows, DOS, and many other platforms. It was originally intended for students to explore mathematical functions and data in a friendly way, but has been used for many scientific and engineering applications since then. Gnuplot supports many types of plots in either 2D or 3D. It can plot functions and data read from ASCII files. Gnuplot can output to a variety of formats, including PNG, PostScript, and SVG.

Numerous works have recently shown that state-of-the-art classifiers are vulnerable to adversarial perturbations. We extend the study of adversarial examples to more complex vision tasks, namely semantic segmentation and object detection. We show that adversarial examples can also be easily generated for these tasks, and that they transfer across datasets and models. We also show that adversarial training can be used to defend against such examples, and that it leads to improved robustness.

Sub-Interface - Layer3 Subinterface

Palo Alto Networks firewalls support Layer 3 routing on subinterfaces to accommodate multiple virtual routers and security zones on a single physical interface. The ability to define subinterfaces is useful when you want to route traffic for multiple virtual routers or security zones through a single physical interface. Each subinterface can be assigned to a different virtual router and security zone. Each subinterface can be configured with its own IP address, static routes, RIP, OSPF, BGP, or multicast routing protocol. Subinterfaces are also useful if you have a firewall that is connected to a switch that is configured for multiple VLANs. You can define a subinterface for each VLAN and assign traffic from each VLAN to a different virtual router and security zone.

Configure a Layer3 Subinterface on the GUI

Step 1. Define the parent interface. Select Network > Interfaces and click the interface name. Select Interface Type Layer3 and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 2. Define the subinterface. Select Network > Interfaces and click Add Subinterface. Enter the Interface Name in the format eth<slot>.<port_number>. Enter the Tag (VLAN ID) and Virtual Router. Select the Security Zone and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 3. Commit the changes. Click Commit.

Verify Layer3 Subinterface Configuration on the GUI

Step 1. Verify the parent interface. Select Network > Interfaces and click the interface name. Select Interface Type Layer3 and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 2. Verify the subinterface. Select Network > Interfaces and click Add Subinterface. Enter the Interface Name in the format eth<slot>.<port_number>. Enter the Tag (VLAN ID) and Virtual Router. Select the Security Zone and configure the IPv4, IPv6 or both addresses, Management Profile, MTU, Link Speed, Link Duplex, and Link State as needed. Click OK.

Step 3. Commit the changes. Click Commit.

"But I must explain to you how all this mistaken idea of denouncing pleasure and praising pain was born and I will give you a complete account of the system, and expound the actual teachings of the great explorer of the truth, the master-builder of human happiness. No one rejects, dislikes, or avoids pleasure itself, because it is pleasure, but because those who do not know how to pursue pleasure rationally encounter consequences that are extremely painful. Nor again is there anyone who loves or pursues or desires to obtain pain of itself, because it is pain, but because occasionally circumstances occur in which toil and pain can procure him some great pleasure. To take a trivial example, which of us ever undertakes laborious physical exercise, except to obtain some advantage from it? But who has any right to find fault with a man who chooses to enjoy a pleasure that has no annoying consequences, or one who avoids a pain that produces no resultant pleasure?"

1.1 Introduction

1.1.1 Why Study Differential Equations?

Differential equations are equations involving derivatives of unknown functions. For example, the equation

$$\frac{dy}{dx} = 2x + 3$$

is a differential equation. Here, y is a function of x, and $\frac{dy}{dx}$ represents the rate at which y changes with respect to x.

Differential equations are fundamental in mathematics because they describe how quantities change over time or in response to other variables. For example, Newton's Second Law, $F = ma$, can be rewritten as $F = m\frac{d^2x}{dt^2}$, where $x(t)$ is the position of an object at time t. This equation allows us to predict the motion of the object by solving for $x(t)$.

Differential equations are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the equation $L\frac{dI}{dt} + RI = V(t)$. Solving this equation allows us to predict how the current changes over time.

1.1.2 Ordinary Differential Equations (ODEs)

An ordinary differential equation (ODE) is a differential equation in which the unknown function depends on a single variable. For example, the equation $\frac{dy}{dx} = 2x + 3$ is an ODE because y depends only on x.

ODEs are used to model systems where the rate of change of a quantity depends on the quantity itself and other factors. For example, the population of a city may be modeled by the ODE $\frac{dP}{dt} = kP$, where $P(t)$ is the population at time t and k is a constant representing the growth rate.

ODEs are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the ODE $L\frac{dI}{dt} + RI = V(t)$. Solving this ODE allows us to predict how the current changes over time.

1.1.3 Partial Differential Equations (PDEs)

A partial differential equation (PDE) is a differential equation in which the unknown function depends on multiple variables. For example, the equation $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ is a PDE because u depends on both x and t.

PDEs are used to model systems where the rate of change of a quantity depends on the quantity itself and other factors. For example, the heat equation $\frac{\partial u}{\partial t} = k\frac{\partial^2 u}{\partial x^2}$ describes how the temperature $u(x,t)$ changes over time and space, where k is a constant representing the thermal conductivity.

PDEs are used in physics, engineering, economics, biology, and many other fields to model dynamic systems. For example, in electrical circuits, the current $I(t)$ in a circuit with resistance R, inductance L, and voltage $V(t)$ is described by the PDE $L\frac{\partial I}{\partial t} + RI = V(t)$. Solving this PDE allows us to predict how the current changes over time and space.

Chapter Chapter 1

Section Introduction

Subsection Introduction to Linear Algebra

Linear Algebra

Linear Algebra

Linear Algebra is the study of vectors and linear transformations between vector spaces.

Example 1.1.1

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Let $T: V \to W$ be defined by

$$T(x, y, z) = (x + y, 2z - x).$$

Then T is a linear transformation.

Proof.

Let $u = (x_1, y_1, z_1)$ and $v = (x_2, y_2, z_2)$ be arbitrary elements of V and let $c \in \mathbb{R}$ be arbitrary.

Then $u + v = (x_1 + x_2, y_1 + y_2, z_1 + z_2)$ and

$$T(u + v) = (x_1 + x_2 + y_1 + y_2, 2(z_1 + z_2) - (x_1 + x_2)) = (x_1 + y_1, 2z_1 - x_1) + (x_2 + y_2, 2z_2 - x_2) = T(u) + T(v).$$

Also, $cu = (cx_1, cy_1, cz_1)$ and

$$T(cu) = (cx_1 + cy_1, 2cz_1 - cx_1) = c(x_1 + y_1, 2z_1 - x_1) = cT(u).$$

Therefore T satisfies both conditions of linearity and is a linear transformation. $\square$

Example 1.1.2

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Let $T: V \to W$ be defined by

$$T(x, y, z) = (x + y, 2z - x + 1).$$

Then T is not a linear transformation because $T(0, 0, 0) = (0, 1) \neq (0, 0)$.

Example 1.1.3

Let $V = \mathbb{R}^3$ and $W = \mathbb{R}^2$.

Let $T: V \to W$ be defined by

Topic:

Question:

Find a unit tangent vector to the curve $r(t) = \langle \sin(t), \cos(t), \sqrt{2}t \rangle$ at the point $(0, 1, \pi\sqrt{2}/4)$.

Solution:

Step 1: Find the derivative $r'(t)$ of the position vector $r(t)$.

$$r'(t) = \langle \cos(t), -\sin(t), \sqrt{2} \rangle$$

Step 2: Evaluate $r'(t)$ at the point $t = \pi/4$ (since $\sin(\pi/4) = \cos(\pi/4) = 1/\sqrt{2}$).

$$r'(\pi/4) = \langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle$$

Step 3: Find the magnitude of $r'(\pi/4)$.

$$|r'(\pi/4)| = \sqrt{(1/\sqrt{2})^2 + (-1/\sqrt{2})^2 + (\sqrt{2})^2} = \sqrt{1/2 + 1/2 + 2} = \sqrt{3}$$

Step 4: Divide $r'(\pi/4)$ by its magnitude to find the unit tangent vector.

$$T(\pi/4) = \frac{r'(\pi/4)}{|r'(\pi/4)|} = \frac{\langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle}{\sqrt{3}} = \langle 1/\sqrt{6}, -1/\sqrt{6}, \sqrt{2/3} \rangle$$

Step 5: Rationalize the denominators.

$$T(\pi/4) = \langle \sqrt{6}/6, -\sqrt{6}/6, \sqrt{6}/3 \rangle$$

Step 6: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 7: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 8: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 9: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 10: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 11: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 12: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 13: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 14: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 15: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 16: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 17: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 18: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 19: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 20: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 21: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 22: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 23: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Abstract
This study investigates the effect of pulsed laser ablation in liquid (PLAL) parameters on the synthesis of gold nanoparticles (AuNPs) using a Nd:YAG laser. The influence of laser fluence (2–6 J/cm²), pulse repetition rate (10–50 Hz), and ablation time (5–30 min) on the size, shape, and optical properties of AuNPs was evaluated. Results showed that increasing laser fluence and repetition rate reduced average particle size from 18 nm to 9 nm, while prolonged ablation time led to aggregation and broadening of the size distribution. UV-Vis spectroscopy confirmed the formation of AuNPs with surface plasmon resonance peaks between 520 and 540 nm. The optimal conditions for producing small, spherical AuNPs were identified as 4 J/cm², 30 Hz, and 15 min. These findings provide a systematic approach for tailoring AuNP properties by controlling laser parameters, which is crucial for their application in biomedicine and catalysis.

Lycopene is a red carotenoid of great importance because it is responsible for the pigment of tomatoes and other red fruits and vegetables and because it has been associated with many health benefits. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Here we report that the transcription factor RIPENING INHIBITOR (RIN) binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Lycopene is a red carotenoid that is responsible for the pigment of tomatoes and other red fruits and vegetables. Lycopene is a precursor of provitamin A and has been associated with many health benefits, such as a reduced risk of cardiovascular disease and certain cancers[1–3]. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Tomato fruits are a major source of lycopene, and lycopene accumulation in tomato fruits is a complex process that is affected by many factors, such as ripening, ethylene, light, temperature, and genotype[4–7]. Ripening-inhibitor (rin) is a recessive mutant that has been used extensively in studies of tomato fruit ripening. The rin mutant fruits do not ripen and do not accumulate lycopene, even in the presence of ethylene[8]. The RIN gene encodes a MADS-box transcription factor that is a master regulator of fruit ripening in tomato[9–12]. Although the RIN protein has been shown to bind to the promoters of several genes that are involved in ethylene biosynthesis and signal transduction, the genes that are directly regulated by RIN and the mechanism by which RIN regulates lycopene accumulation are unknown. Here we show that RIN binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Abstract

Recent research suggests that people who believe that science and technology are responsible for environmental problems tend to underestimate science's ability to solve these problems.

Abstract

This study presents a variational approach to simulate the electron density distribution in the hydrogen molecular ion (H_2^+) using trial wavefunctions and numerical optimization techniques. The ground state energy and electron density are calculated for various internuclear distances and compared with exact results. The results show that the variational method provides accurate electron density distributions with minimal computational cost. The study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems.

1. Introduction

The hydrogen molecular ion (H_2^+) is the simplest molecular system and serves as a fundamental benchmark for quantum mechanical calculations. Despite its simplicity, it exhibits all the essential features of chemical bonding, including electron sharing between two nuclei and the formation of a stable molecular orbital. The study of H_2^+ provides insights into the nature of chemical bonds and serves as a test case for more complex molecular systems.

The electron density distribution in H_2^+ is crucial for understanding the nature of the chemical bond. The electron density determines the strength of the bond, the bond length, and the vibrational frequencies. Accurate calculation of electron density is essential for predicting molecular properties and understanding chemical reactivity.

Variational methods are powerful tools for calculating molecular properties. These methods provide upper bounds to the ground state energy and allow for the calculation of electron density distributions. The variational method is particularly useful for systems where exact solutions are not available.

This study presents a variational approach to simulate the electron density distribution in H_2^+. The study compares the results with exact calculations and demonstrates the effectiveness of simple variational methods for quantum mechanical simulations.

2. Theoretical Background

2.1 Schrödinger Equation

The time-independent Schrödinger equation for H_2^+ is:

$$H\psi = E\psi$$

where H is the Hamiltonian operator, ψ is the wavefunction, and E is the energy.

2.2 Hamiltonian Operator

The Hamiltonian operator for H_2^+ is:

$$H = -\frac{\nabla_1^2}{2} - \frac{\nabla_2^2}{2} - \frac{1}{r_{a1}} - \frac{1}{r_{b1}} + \frac{1}{R}$$

where ∇_1^2 and ∇_2^2 are the Laplacian operators for electrons 1 and 2, r_{a1} and r_{b1} are the distances from electron 1 to nuclei a and b, and R is the internuclear distance.

2.3 Variational Principle

The variational principle states that for any trial wavefunction ψ_{trial}, the energy E_{trial} satisfies:

$$E_{trial} = \frac{\langle \psi_{trial} | H | \psi_{trial} \rangle}{\langle \psi_{trial} | \psi_{trial} \rangle} \geq E_0 \quad (1)$$

where E_0 is the ground state energy.

2.4 Trial Wavefunction

The trial wavefunction used in this study is:

$$\psi_{trial} = \frac{1}{\sqrt{2(1+S)}}(\phi_a + \phi_b) \quad (2)$$

where ϕ_a and ϕ_b are hydrogen 1s orbitals centered on nuclei a and b, and S is the overlap integral between these orbitals.

3. Methodology

3.1 Computational Approach

The computational approach involves the following steps:

1. Calculation of overlap integrals
2. Calculation of kinetic energy integrals
3. Calculation of potential energy integrals
4. Optimization of the variational parameter
5. Calculation of electron density distribution

3.2 Overlap Integral

The overlap integral between two hydrogen 1s orbitals is:

$$S = \int \phi_a \phi_b \, d\tau = \left(1 + \frac{R}{a_0} + \frac{R^2}{3a_0^2}\right) e^{-R/a_0} \quad (3)$$

where a_0 is the Bohr radius.

3.3 Kinetic Energy Integral

The kinetic energy integral is:

$$T = \int \phi_a \left(-\frac{\nabla^2}{2}\right) \phi_b \, d\tau = \frac{1}{2}\left(1 + \frac{R}{a_0}\right) e^{-R/a_0} \quad (4)$$

3.4 Potential Energy Integral

The potential energy integral is:

$$V = \int \phi_a \left(-\frac{1}{r_{a1}} - \frac{1}{r_{b1}}\right) \phi_b \, d\tau = -\left(1 + \frac{1}{R}\right) e^{-2R/a_0} \quad (5)$$

3.5 Optimization

The variational parameter is optimized using the golden section search method. The optimization minimizes the energy E_{trial} with respect to the variational parameter.

3.6 Electron Density Calculation

The electron density is calculated from the trial wavefunction as:

$$\rho(r) = |\psi_{trial}|^2$$

4. Results and Discussion

4.1 Ground State Energy

The ground state energy calculated using the variational method for various internuclear distances is compared with exact results. The results show that the variational method provides accurate energy values with minimal computational cost.

4.2 Electron Density Distribution

The electron density distribution calculated using the variational method shows the expected features of a chemical bond, including electron sharing between the two nuclei and the formation of a molecular orbital. The electron density is maximum between the nuclei and decreases with distance from the nuclei.

4.3 Comparison with Exact Results

The results are compared with exact results from literature. The variational method provides accurate results for the ground state energy and electron density distribution. The accuracy of the method depends on the quality of the trial wavefunction and the optimization of the variational parameter.

5. Conclusion

This study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems. The variational method provides accurate results for the ground state energy and electron density distribution with minimal computational cost. The study shows that simple trial wavefunctions can provide accurate results when properly optimized.

The results show that the variational method provides accurate results for the ground state energy and electron density distribution. The accuracy of the method depends on the quality of the trial wavefunction and the optimization of the variational parameter.

The study demonstrates the effectiveness of simple variational methods for quantum mechanical simulations of molecular systems. The variational method provides accurate results for the ground state energy and electron density distribution with minimal computational cost.

MATLAB/Simulink Model Based Design Workflow

Introduction

Model Based Design (MBD) is a formal methodology for developing complex control systems. It uses a single mathematical model as the central artifact from which requirements, simulation, code generation, and verification are derived. The model serves as the ground truth for all downstream activities, ensuring that changes propagate consistently across the entire development lifecycle.

Workflow Overview

The workflow consists of six stages: requirements capture, plant modeling, controller design, simulation and verification, code generation, and deployment. Each stage produces artifacts that feed into the next stage. Traceability links connect requirements to model elements to generated code to test results, so that any change can be assessed for its impact on every downstream artifact.

Plant Modeling

Plant modeling begins with the physical equations governing the system. For a DC motor, the equations are:

$$v(t) = Ri(t) + L\frac{di(t)}{dt} + K_e\omega(t)$$

$$J\frac{d\omega(t)}{dt} = K_t i(t) - B\omega(t) - \tau_L(t)$$

Controller Design

The controller is designed in the discrete domain. For a PI controller with sampling period T_s:

$$u[k] = K_p e[k] + K_i T_s \sum_{j=0}^{k} e[j]$$

Simulink Implementation

Simulink provides a block diagram environment for implementing the plant model and controller. Signal flow is explicit and visual. Simulink supports fixed-step and variable-step solvers, with fixed-step solvers required for real-time code generation.

Code Generation

Simulink Coder (formerly Real-Time Workshop) generates C code from the model. The generated code is deterministic, with no dynamic memory allocation and no recursion. Code generation can be configured for different target processors and optimization levels.

Verification

Model-in-the-loop (MIL) simulation verifies the model against requirements before code generation. Software-in-the-loop (SIL) simulation runs the generated code on a host machine to verify that the code behaves identically to the model. Hardware-in-the-loop (HIL) simulation runs the code on the target hardware with real sensors and actuators.

Deployment

Deployment packages the generated code with the target hardware's boot code and runtime libraries. Over-the-air (OTA) updates allow deployed systems to receive new versions without physical access.

Conclusion

Model Based Design provides a single source of truth for requirements, simulation, and implementation. Changes propagate automatically through the workflow, reducing the risk of inconsistencies between specification and implementation.

1.1 Introduction to Data Structures and Algorithms

Data structures and algorithms are the foundation of computer science. Understanding how to organize data efficiently and how to design algorithms that solve problems quickly is essential for any programmer.

1.1.1 Why Study Data Structures and Algorithms?

Consider a simple problem: you have a list of 1,000,000 numbers and you need to find the largest one. A naive approach might scan the entire list for each query. With the right data structure, you can answer the question in constant time. The difference between a slow program and a fast program can be the difference between a project that works and one that never finishes.

Data structures and algorithms are the tools that make computers fast and reliable. They are used in every domain: finance, medicine, engineering, science, and everyday software. Mastering them gives you the ability to design systems that scale from a few users to millions of users.

1.1.2 Formal Definitions

Let n denote the size of the input. We write $f(n) = O(g(n))$ if there exists constants $c > 0$ and $n_0 \geq 0$ such that $f(n) \leq c \cdot g(n)$ for all $n \geq n_0$. Similarly, $f(n) = \Omega(g(n))$ if $f(n) \geq c \cdot g(n)$ for all $n \geq n_0$, and $f(n) = \Theta(g(n))$ if both hold.

Formally, a data structure is a tuple $(D, \mathcal{O})$ where D is the set of possible states and $\mathcal{O}$ is a set of operations that transform states in D.

1.1.3 Example

```
def binary_search(arr, target):
    lo, hi = 0, len(arr) - 1
    while lo <= hi:
        mid = (lo + hi) // 2
        if arr[mid] == target:
            return mid
        elif arr[mid] < target:
            lo = mid + 1
        else:
            hi = mid - 1
    return -1
```

Binary search runs in $O(\log n)$ time. Each iteration halves the search space, so after k iterations the remaining range has size $n / 2^k$. When $k = \log_2 n$, the range has size 1 and the algorithm terminates.

Chapter 4 Matrix Algebra

4.1 Sum and Scalar Product of Matrices

Definition

Sum of two matrices Two matrices A and B are said to be conformable for addition if they are of the same order. If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ then the sum of A and B is defined as $A + B = [a_{ij} + b_{ij}]_{m \times n}$.

Scalar product If $A = [a_{ij}]_{m \times n}$ and k is a scalar then $kA = [ka_{ij}]_{m \times n}$.

Abstract: Artificial Intelligence (AI) is rapidly transforming healthcare by enhancing diagnostic accuracy, optimizing treatment plans, and improving patient outcomes. However, the integration of AI in healthcare raises significant ethical concerns, including data privacy, algorithmic bias, accountability, and the potential displacement of human caregivers. This study explores the ethical implications of AI in healthcare, focusing on the balance between innovation and patient rights. The study examines the ethical challenges associated with AI in healthcare, including the impact on patient autonomy, the potential for discrimination, and the need for transparency and accountability. The study also discusses the regulatory frameworks and guidelines that can ensure the ethical deployment of AI in healthcare, ensuring that the benefits of AI are maximized while safeguarding patient rights and maintaining trust in healthcare systems. The study concludes with recommendations for policymakers, healthcare providers, and AI developers to address the ethical challenges and promote the responsible use of AI in healthcare.

Ch. 2 Lo-Fi Prototyping

Introduction

Lo-fi prototyping is the process of using low-tech materials to create prototypes of your product. Lo-fi prototyping is a technique that can be used at any stage in the design of a product, but it is most useful in the early stages of the design process. Lo-fi prototyping is a technique that can be used by designers, developers, and non-designers alike.

Why Lo-Fi Prototyping?

Lo-fi prototyping is a technique that can be used by designers, developers, and non-designers alike. It is most useful in the early stages of the design process.

Abstract

Deep learning (DL) models have shown promising performance in medical imaging tasks, including the detection of diabetic retinopathy (DR) and other eye diseases. However, it remains unclear how these models generalize to real-world clinical settings. Here we assess the generalizability of DL models for DR detection from fundus photographs across ethnicity, imaging camera, and disease severity and type in a dataset of 236,234 images from 40,339 diabetic patients. We find that the performance of DL models for referable DR detection is comparable across Asian, Caucasian, and African ethnicities (AUC: 0.936–0.946), but varies across cameras (AUC: 0.906–0.947) and is lower in severe DR (AUC: 0.885) and proliferative DR (AUC: 0.901) compared to moderate DR (AUC: 0.943). These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Introduction

Diabetes mellitus (DM) is a chronic disease that affects 463 million people worldwide and is projected to rise to 700 million by 2045[1]. Diabetic retinopathy (DR) is a common complication of DM and a major cause of blindness and vision impairment worldwide[2]. Early detection of DR followed by timely treatment can prevent vision loss[3], and thus, DM patients are recommended to undergo yearly DR screening[4]. However, in many countries, the shortage of eye care specialists and the high prevalence of DM make such a task difficult to accomplish[5]. Deep learning (DL) models have shown promising performance in the detection of DR from fundus photographs, with several studies reporting high sensitivity and specificity in retrospective datasets[6–9]. However, it remains unclear how these models generalize to real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Here we assess the generalizability of a DL model for referable DR (RDR) detection across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the United Kingdom (UK) Biobank[14].

Results

Study population characteristics

The UK Biobank dataset consisted of 236,234 fundus photographs from 40,339 diabetic patients, of which 1,401 (3.5%) had RDR, 1,067 (2.6%) had moderate DR, 1,250 (3.1%) had severe DR, and 1,175 (2.9%) had proliferative DR (PDR). Mean (SD) age was 56.8 (8.1) years, 23,561 (58.4%) were male, 1,937 (4.8%) were Asian, 1,478 (3.7%) were African, and 36,924 (91.5%) were Caucasian. Mean (SD) HbA1c was 75.1 (19.7) mmol/mol (9.0 (1.8)%), 3,553 (8.8%) had insulin treatment, and mean (SD) duration of DM was 8.7 (8.1) years. Mean (SD) age was 55.4 (8.1) years for those with RDR, 55.8 (8.1) years for those with moderate DR, 56.4 (8.1) years for those with severe DR, and 56.1 (8.1) years for those with PDR. Mean (SD) HbA1c was 81.0 (21.3) mmol/mol (9.6 (1.9)%) for those with RDR, 77.4 (19.9) mmol/mol (9.3 (1.8)%) for those with moderate DR, 79.4 (20.1) mmol/mol (9.4 (1.8)%) for those with severe DR, and 79.9 (20.4) mmol/mol (9.5 (1.9)%) for those with PDR. Insulin treatment was 14.1% (RDR), 12.1% (moderate DR), 13.8% (severe DR), and 13.8% (PDR). Mean (SD) duration of DM was 10.7 (8.4) years for those with RDR, 10.1 (8.2) years for those with moderate DR, 10.8 (8.2) years for those with severe DR, and 10.8 (8.2) years for those with PDR. Other baseline characteristics by DR status are shown in Table 1.

Performance of DL models for referable DR detection

We trained a DL model to detect RDR using fundus photographs from patients of Caucasian ethnicity, imaging with a Topcon camera, and without severe DR or PDR. The model achieved an AUC of 0.943 (95% CI: 0.937–0.949) in a randomly sampled test set of 9,000 images from 9,000 patients. The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2). The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2).

Performance of DL models across ethnicities

The model achieved an AUC of 0.936 (95% CI: 0.914–0.957) in Asian patients, 0.946 (95% CI: 0.935–0.956) in African patients, and 0.943 (95% CI: 0.937–0.949) in Caucasian patients (Table 2). The model achieved a sensitivity of 0.879 (95% CI: 0.821–0.927) in Asian patients, 0.893 (95% CI: 0.865–0.918) in African patients, and 0.885 (95% CI: 0.869–0.901) in Caucasian patients (Table 2). The model achieved a specificity of 0.854 (95% CI: 0.824–0.883) in Asian patients, 0.863 (95% CI: 0.844–0.882) in African patients, and 0.857 (95% CI: 0.853–0.861) in Caucasian patients (Table 2).

Performance of DL models across disease severity and type

The model achieved an AUC of 0.885 (95% CI: 0.867–0.903) in severe DR and 0.901 (95% CI: 0.882–0.919) in PDR, compared to an AUC of 0.943 (95% CI: 0.937–0.949) in those without severe DR or PDR. The model achieved a sensitivity of 0.838 (95% CI: 0.807–0.868) in severe DR and 0.854 (95% CI: 0.824–0.883) in PDR, compared to a sensitivity of 0.885 (95% CI: 0.869–0.901) in those without severe DR or PDR. The model achieved a specificity of 0.858 (95% CI: 0.854–0.862) in severe DR and 0.857 (95% CI: 0.853–0.861) in PDR, compared to a specificity of 0.857 (95% CI: 0.853–0.861) in those without severe DR or PDR. Other performance metrics by DR severity and type are shown in Table 2.

Discussion

In this study, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Prior studies have shown promising performance of DL models for DR detection from fundus photographs, with several reporting sensitivities and specificities of over 90% in retrospective datasets[6–9]. However, it remains unclear how these models would perform in real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Our study addresses these gaps in the literature by assessing the performance of a DL model across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank.

Our study shows that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation. The lower performance in severe DR and PDR suggests that DL models may miss some of the most severe cases of DR, which are the cases that require urgent referral to an eye care specialist[3]. The lower performance when applied to images from a camera not used in the development dataset suggests that DL models may be sensitive to the specific characteristics of the cameras used in the development dataset, and that they may not generalize well to other cameras. The lower performance in some ethnicities suggests that DL models may be biased toward the ethnicities in the development dataset, and that they may not generalize well to other ethnicities.

Our study has several strengths. We used a large dataset of diabetic patients from the UK Biobank, which is a prospective cohort study of over 500,000 participants from the United Kingdom (UK) aged between 40 and 69 at recruitment[14]. The UK Biobank dataset is representative of the UK population in terms of ethnicity, socioeconomic status, and health status[15], and thus, our study results may be generalizable to other populations with similar characteristics. We used a state-of-the-art DL model for DR detection[16], and we assessed its performance across ethnicities, cameras, and disease severities and types, which has not been done in prior studies. We also used a large sample size to ensure that our results were precise and that we had enough power to detect differences in performance across subgroups.

Our study has several limitations. First, we used only one DL model for DR detection, and our results may not generalize to other DL models. Second, we used only one camera for the development dataset, and our results may not generalize to other cameras. Third, we used only one ethnicity for the development dataset, and our results may not generalize to other ethnicities. Fourth, we used only one disease severity and type for the development dataset, and our results may not generalize to other disease severities and types. Fifth, we used only one dataset for our study, and our results may not generalize to other datasets. Sixth, we did not assess the impact of other factors on the performance of the DL model, such as age, sex, and comorbidities, and these factors may affect the performance of the DL model.

In conclusion, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

1.1 Introduction

Computer science is the study of algorithms, including their efficiency, their limitations, and their mathematical properties. Related fields examine computer hardware, programming languages, and computer applications in various disciplines. This chapter introduces some of the mathematical notation and techniques used in the study of algorithms, and it reviews some of the data structures that are used in the algorithms presented in later chapters.

1.2 Mathematical Notation and Functions

Let $\mathbb{R}$ denote the set of real numbers, $\mathbb{Z}$ denote the set of integers, and $\mathbb{N}$ denote the set of natural numbers (integers greater than or equal to zero). If x is a real number, then $\lfloor x \rfloor$ denotes the largest integer less than or equal to x, and $\lceil x \rceil$ denotes the smallest integer greater than or equal to x. For example, $\lfloor 3.14 \rfloor = 3$ and $\lceil 3.14 \rceil = 4$. Given two integers a and b, $a \bmod b$ denotes the remainder when a is divided by b, and $a \equiv b \pmod{c}$ means that $a - b$ is a multiple of c. For example, $7 \bmod 3 = 1$ and $7 \equiv 1 \pmod{3}$.

1.2.1 Logarithms and Exponents

Unless otherwise specified, all logarithms are base 2. For $x > 0$, $\log(x)$ denotes the base-2 logarithm of x. For $x > 0$ and $y > 0$, $\log(xy) = \log(x) + \log(y)$. For $x > 0$ and $y > 0$, $\log(x/y) = \log(x) - \log(y)$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$.

1.2.2 Factorial and Binomial Coefficients

For $n \in \mathbb{N}$, $n!$ denotes the factorial of n, defined as $n! = n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1$. For $n \in \mathbb{N}$, $n! = n \cdot (n-1)!$. For $n \in \mathbb{N}$, $n! = \prod_{i=1}^{n} i

UNITED STATES DISTRICT COURT
DISTRICT OF MASSACHUSETTS

Dr. Sarah Mitchell-Rodriguez, Ms. Jessica Tran, Mr. Daniel Okafor, and Ms. Priyanka Desai,
Plaintiffs,
v.
Dr. Robert Hayes, in his official capacity as Commissioner of the Massachusetts Department of Public Health,
Defendant.

Civil Action No. 1:20-cv-12345-RGS

COMPLAINT FOR DECLARATORY AND INJUNCTIVE RELIEF

Jury Demand Not Applicable

Plaintiffs Dr. Sarah Mitchell-Rodriguez, Ms. Jessica Tran, Mr. Daniel Okafor, and Ms. Priyanka Desai (collectively, "Plaintiffs") bring this complaint against Defendant Dr. Robert Hayes, in his official capacity as Commissioner of the Massachusetts Department of Public Health (the "Commissioner"), and allege as follows:

I. INTRODUCTION

1. Plaintiffs seek to compel the Commissioner to comply with the Medicaid Act's requirement that state agencies "promptly" process Medicaid applications. Despite this unambiguous mandate, the Commissioner has adopted a practice of holding applications for weeks or months while requesting documents that are not required by law, leaving low-income residents without coverage for medically necessary care. This practice violates the Medicaid Act, 42 U.S.C. § 1396a(a)(8), and the Fourteenth Amendment to the United States Constitution. Plaintiffs seek a declaration that the challenged practice is unlawful and an injunction requiring the Commissioner to process applications promptly and to stop requesting documents not required by the Medicaid Act.

II. JURISDICTION AND VENUE

2. This Court has jurisdiction under 28 U.S.C. § 1331 (federal question) and 28 U.S.C. § 1343(a)(3) (civil rights). Plaintiffs' claims for declaratory and injunctive relief are authorized by 28 U.S.C. § 2201 and Rule 65 of the Federal Rules of Civil Procedure.

3. Venue is proper in this District under 28 U.S.C. § 1391(b)(2) because a substantial part of the events or omissions giving rise to the claims occurred in this District, including the denial of Plaintiff Jessica Tran's application while she was a resident of Worcester County, Massachusetts.

III. PARTIES

4. Plaintiff Dr. Sarah Mitchell-Rodriguez is a resident of Worcester County, Massachusetts. She is a practicing family medicine physician and the mother of a 9-year-old daughter who is enrolled in MassHealth. She brings this action on her own behalf and on behalf of her minor daughter.

5. Plaintiff Ms. Jessica Tran is a resident of Worcester County, Massachusetts. She is a single parent of two children and a part-time community college student. She applied for MassHealth in March 2024 and was denied coverage for her children after the Department requested documents she had already provided.

6. Plaintiff Mr. Daniel Okafor is a resident of Hampden County, Massachusetts. He is a self-employed carpenter and the father of a 14-year-old son who has asthma and requires regular medication. His family's application has been pending since February 2024.

7. Plaintiff Ms. Priyanka Desai is a resident of Middlesex County, Massachusetts. She is a graduate student and a mother of one. Her application was denied because she could not produce a document that the Department requested but that is not required by the Medicaid Act.

8. Defendant Dr. Robert Hayes is the Commissioner of the Massachusetts Department of Public Health. He is sued in his official capacity. The Commissioner is responsible for the administration of MassHealth and the processing of applications for benefits.

IV. LEGAL BACKGROUND

9. The Medicaid Act requires that a state plan provide that "all individuals wishing to make application for medical assistance under the plan shall have opportunity to file such applications, and that such applications shall be promptly processed." 42 U.S.C. § 1396a(a)(8). The Act does not authorize a state agency to deny or delay a complete application because it requests documents not required by the statute.

10. The Fourteenth Amendment to the United States Constitution guarantees that no state shall deprive any person of life, liberty, or property without due process of law. A state agency's practice of withholding benefits for reasons not authorized by the governing statute violates the right to due process.

V. FACTS

11. Dr. Mitchell-Rodriguez's daughter qualified for MassHealth when her family's income fell below the statutory threshold in January 2023. The family renewed coverage in December 2023 and provided all documents required by the Department. The renewal was approved in 14 days.

12. Ms. Tran applied for MassHealth for herself and her two children in March 2024. She provided her pay stubs, her children's birth certificates, and her lease. The Department requested a sixth document, a letter from her employer, that is not required by the Medicaid Act. The application has been pending for 5 months. Ms. Tran's children have been uninsured since their previous coverage ended in February 2024.

13. Mr. Okafor's son has been prescribed a daily inhaler and a rescue inhaler. The family's income is approximately $31,200 per year, well below the MassHealth threshold. The application has been pending since February 2024. The family has been paying out of pocket for the inhaler, which costs $[illegible] per month.

14. Ms. Desai's application was denied because she could not produce a document the Department requested. She then filed a new application and provided the document. The second application was approved within 10 days. The delay caused her to miss two months of coverage.

15. The Department's practice of requesting documents not required by the Medicaid Act has caused the denial, delay, and loss of coverage for hundreds of applicants in the past two years, according to Department of Public Health data produced in discovery in a separate matter.

Abstract: This study aimed to investigate the ethnobotanical uses of medicinal plants used by the inhabitants of Mirpur Sakro District, Tharparkar, Sindh, Pakistan. Data were collected through questionnaires and interviews with local people. A total of 10 medicinal plants belonging to 10 families were recorded. The most frequently used plants were Calotropis procera and Tribulus terrestris. The results indicate that the local people rely on these plants for various ailments, including digestive disorders, skin diseases, and respiratory problems. The study highlights the importance of traditional knowledge in the region and suggests the need for further pharmacological and phytochemical investigations to validate the traditional uses and ensure sustainable utilization of these resources.

7.2 Cluster Representations

7.2.1 Centroids and Prototypes (Medoids)

Definition. Let $C_k = \{x_1, x_2, \ldots, x_{n_k}\}$ be a cluster with n_k points. The **centroid** (or **mean**) of C_k is the point

$$\mu_k = \frac{1}{n_k} \sum_{i=1}^{n_k} x_i$$

Example 7.2.1. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1)\}$. Then

$$\mu_1 = \frac{1}{3}\left((1,2) + (2,3) + (3,1)\right) = \frac{1}{3}(6,6) = (2,2)$$

Proposition 7.2.1. The centroid μ_k minimizes the sum of squared distances to the points in C_k:

$$\mu_k = \arg\min_{\mu \in \mathbb{R}^d} \sum_{i=1}^{n_k} \|x_i - \mu\|^2$$

Proof. Expand the objective:

$$\sum_{i=1}^{n_k} \|x_i - \mu\|^2 = \sum_{i=1}^{n_k} \|x_i\|^2 - 2\mu^T \sum_{i=1}^{n_k} x_i + n_k \|\mu\|^2$$

This is a quadratic in μ. Setting the gradient to zero:

$$\nabla_\mu \left[\sum_{i=1}^{n_k} \|x_i - \mu\|^2\right] = -2\sum_{i=1}^{n_k} x_i + 2n_k\mu = 0$$

$$\Rightarrow \mu = \frac{1}{n_k}\sum_{i=1}^{n_k} x_i$$

Remark. The centroid is not necessarily a data point. For example, the centroid of $\{(0,0), (1,0)\}$ is $(0.5, 0)$, which is not a data point.

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Example 7.2.2. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1), (100,100)\}$. The centroid is $\mu_1 = (26.5, 26.5)$, which is far from most points. The medoid is $m_1 = (2,3)$, which is much closer to the majority of points.

7.2.2 Medoids

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Example 7.2.2. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1), (100,100)\}$. The centroid is $\mu_1 = (26.5, 26.5)$, which is far from most points. The medoid is $m_1 = (2,3)$, which is much closer to the majority of points.

7.2.3 Medoids

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Example 7.2.2. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1), (100,100)\}$. The centroid is $\mu_1 = (26.5, 26.5)$, which is far from most points. The medoid is $m_1 = (2,3)$, which is much closer to the majority of points.

7.2.4 Medoids

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Lesson Twenty-one | Matrix Multiplication and Inverses

Matrix multiplication is the heart of linear algebra. It is how we combine two transformations into one, how we solve systems of equations, how we compute eigenvalues, how we train neural networks. Today we derive it from first principles and understand why it works the way it does.

Author: Prof. Elena V. Kozlova | Computational Mathematics Group

---

1. Motivation: Why Do We Need Matrix Multiplication?

Suppose we have two linear transformations $T_1 : \mathbb{R}^n \to \mathbb{R}^m$ and $T_2 : \mathbb{R}^m \to \mathbb{R}^p$. Their composite $T_2 \circ T_1 : \mathbb{R}^n \to \mathbb{R}^p$ is also linear. If A represents T_1 and B represents T_2, we want a matrix C such that

$$(T_2 \circ T_1)(\mathbf{x}) = C\mathbf{x} \quad \text{for all } \mathbf{x} \in \mathbb{R}^n.$$

We want C to be the product BA.

---

2. Definition

Definition 2.1 (Matrix Multiplication). Let $A \in \mathbb{R}^{m \times n}$ and $B \in \mathbb{R}^{n \times p}$. The product $C = AB \in \mathbb{R}^{m \times p}$ is defined by

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj}, \qquad 1 \le i \le m, \; 1 \le j \le p.$$

---

3. Properties

Theorem 3.1 (Properties of Matrix Multiplication). Assuming the sizes match, the following hold:

1. **Associativity:** $(AB)C = A(BC)$.
2. **Distributivity:** $A(B + C) = AB + AC$ and $(A + B)C = AC + BC$.
3. $(AB)^T = B^T A^T$.
4. $\det(AB) = \det(A)\det(B)$.
5. $\operatorname{tr}(AB) = \operatorname{tr}(BA)$.

Proof. (1) Associativity follows from the fact that $(AB)C$ and $A(BC)$ both compute the (i,j) entry of the triple product $\sum_{k,l} a_{ik} b_{kl} c_{lj}$. (2) Distributivity follows from the distributivity of scalar multiplication. (3) $(AB)^T_{ij} = (AB)_{ji} = \sum_k a_{jk} b_{ki} = \sum_k b_{ki} a_{jk} = (B^T A^T)_{ij}$. (4) Taken for granted for now; we will prove it in Lesson Twenty-two. (5) $\operatorname{tr}(AB) = \sum_i \sum_k a_{ik} b_{ki} = \sum_k \sum_i b_{ki} a_{ik} = \operatorname{tr}(BA)$. □

Warning. Matrix multiplication is not commutative. In general $AB \neq BA$. Even when both products exist and have the same size, $AB = BA$ only if A and B commute.

---

4. Inverses

Definition 4.1 (Inverse). A square matrix $A \in \mathbb{R}^{n \times n}$ is invertible if there exists A^{-1} such that

$$AA^{-1} = A^{-1}A = I_n.$$

Theorem 4.2 (Uniqueness). If A is invertible, A^{-1} is unique.

Proof. If B and C both satisfy $AB = BA = I$ and $AC = CA = I$, then $B = BI = B(AC) = (BA)C = IC = C$. □

Theorem 4.3 (Properties of Inverses).

1. $(AB)^{-1} = B^{-1}A^{-1}$.
2. $(A^T)^{-1} = (A^{-1})^T$.
3. $\det(A^{-1}) = 1/\det(A)$.

---

5. Exercises

Exercise 5.1. Compute $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$ by hand.

Exercise 5.2. Show that $(AB)^{-1} = B^{-1}A^{-1}$ when A and B are invertible.

Exercise 5.3. Prove that $\operatorname{tr}(AB) = \operatorname{tr}(BA)$ without using the formula $c_{ij} = \sum_k a_{ik} b_{kj}$.

---

6. Closing Remarks

Matrix multiplication is the engine of linear algebra. Every theorem we will prove in the next few lessons depends on it. Lesson Twenty-two: determinants. Lesson Twenty-three: eigenvalues. Lesson Twenty-four: the spectral theorem. Lesson Twenty-five: applications to machine learning.

第一章 Flutter 基础概念和设计

1.1 Widget 是一切 UI 的基本单位

Flutter 的核心哲学是一切皆 Widget。

```
Widget ::= StatelessWidget | StatefulWidget | InheritedWidget | RenderObjectWidget
StatelessWidget ::= 不可变，build() 只依赖 Widget 自身和 BuildContext
StatefulWidget ::= 可变，通过 State 对象持有状态，State.build() 依赖 Widget 自身、BuildContext 和 State 内部状态
BuildContext ::= 指向 Element 树中对应节点的只读句柄
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.2 三棵树的关系

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{inflate}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject\ Tree}$$

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{diff}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{layout,\ paint}} \mathrm{Screen}$$

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.3 Widget 不可变性

Widget 一旦创建，其属性全部 `final`。`build()` 每次调用返回全新 Widget 实例，旧实例丢弃。Element 通过 `canUpdate(oldWidget, newWidget)` 判断能否复用：`runtimeType` 相同且 `key` 相同则复用，否则销毁重建。

1.4 Element 生命周期

```
Element ::= 挂载 (mount) → 活跃 (active) → 卸载 (unmount)
mount ::= 调用 Widget.createElement() → 子节点递归 mount → 插入 RenderObject 树
unmount ::= 递归 unmount 子节点 → 从 RenderObject 树移除 → 释放 State.dispose()
```

1.5 RenderObject 层

```
RenderObject ::= 布局 (layout) → 绘制 (paint) → 合成 (composite)
layout ::= 父节点传入 BoxConstraints → 子节点计算自己的 Size → 父节点决定子节点的 offset
paint ::= 生成 Layer 树 → 提交给 Skia/Impeller 渲染引擎
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.6 Key 的作用

```
Key ::= 唯一标识符，用于 Element 复用判断
LocalKey ::= ValueKey | ObjectKey | UniqueKey
GlobalKey ::= 全局唯一，跨 Widget 树移动时保持 State 不丢失
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.7 BuildContext 的本质

```
BuildContext ::= 指向 Element 树中对应节点的只读句柄
context.findAncestorWidgetOfExactType<T>() ::= 沿 Element 树向上遍历，返回类型匹配的祖先 Widget
context.findRenderObject() ::= 返回 Element 对应的 RenderObject
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

MR. TIGER MAGNIFICENT

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

In what distant deeps or skies

Burnt the fire of thine eyes?

On what wings dare he aspire?

What the hand dare seize the fire?

And what shoulder, and what art,

Could twist the sinews of thy heart?

And when thy heart began to beat,

What dread hand? And what dread feet?

What the hammer? What the chain,

In what furnace was thy brain?

What the anvil? What dare

Grasp thy deadly terrors clare?

When the stars threw down their spears

And water'd heaven with their tears,

Did he smile his work to see?

Did he who made the lamb make thee?

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

Abstract: This document provides a comprehensive analysis of the Antoine equation, a fundamental tool in chemical engineering for calculating vapor pressure. We begin with the derivation of the equation from the Clausius-Clapeyron relation, discuss its parameters and their physical significance, and provide a step-by-step guide for fitting the equation to experimental data using nonlinear regression. The document includes a critical discussion of the equation's limitations, including its accuracy over different temperature ranges and its extrapolation behavior, and concludes with a review of alternative models such as the Wagner equation and the Clarke-Glew equation. This work is intended for students and practitioners who need a robust understanding of vapor pressure calculations.

1.1 Introduction

Consider the system of equations

$$\begin{aligned} x_1 + 2x_2 &= 3 \\ 3x_1 - x_2 &= 1 \end{aligned}$$

Any pair of numbers (x_1, x_2) satisfying both equations is a solution. The set of all such solutions is the solution set.

1.2 Gaussian Elimination

Step 1: Multiply the first equation by 3 and subtract from the second:

$$\begin{aligned} x_1 + 2x_2 &= 3 \\ -7x_2 &= -8 \end{aligned}$$

Step 2: Back substitution:

$$x_2 = \frac{8}{7}, \quad x_1 = 3 - 2x_2 = \frac{5}{7}$$

1.3 Matrix Notation

Write the system in matrix form:

$$\begin{bmatrix} 1 & 2 \\ 3 & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

1.4 Exercises

1. Solve the system $x_1 + x_2 = 2$, $2x_1 - x_2 = 0$ by elimination.
2. Write the system in matrix form and verify your solution satisfies $A\mathbf{x} = \mathbf{b}$.
3. Show that the system $x_1 + 2x_2 = 3$, $2x_1 + 4x_2 = 6$ has infinitely many solutions.

2.1 Vectors

Vectors are ordered lists of numbers. Here, $\mathbf{v} = (3, 1, -2)$ and $\mathbf{w} = (1, 0, 4)$ are two vectors in $\mathbb{R}^3$.

2.2 Vector Addition

Vector addition is performed component-wise:

$$\mathbf{v} + \mathbf{w} = (3+1, 1+0, -2+4) = (4, 1, 2)$$

2.3 Scalar Multiplication

Multiplying a vector by a scalar c scales each component:

$$2\mathbf{v} = (6, 2, -4)$$

2.4 Exercises

1. Compute $\mathbf{v} - \mathbf{w}$ and $3\mathbf{v} + 2\mathbf{w}$.
2. Find the scalar c such that $c\mathbf{v} = \mathbf{w}$, if possible.
3. Show that $\mathbf{v} + \mathbf{w} = \mathbf{w} + \mathbf{v}$ (commutativity).

3.1 Dot Product

The dot product of two vectors is a scalar:

$$\mathbf{v} \cdot \mathbf{w} = 3 \cdot 1 + 1 \cdot 0 + (-2) \cdot 4 = -5$$

3.2 Exercises

1. Compute $\mathbf{v} \cdot \mathbf{v}$.
2. Show that $\mathbf{v} \cdot \mathbf{w} = \mathbf{w} \cdot \mathbf{v}$.

THE STATE OF CALIFORNIA IS PLEDGED TO PAY THIS CHECK.

1.1 Cartesian coordinates in the plane

Let O be a fixed point and $\mathbf{i}, \mathbf{j}$ two unit vectors perpendicular to one another. Every point P in the plane is identified with the ordered pair (x, y) of real numbers for which

$$\overrightarrow{OP} = x\,\mathbf{i} + y\,\mathbf{j}.$$

The number x is the abscissa and y the ordinate of P. Conversely, every ordered pair $(x, y) \in \mathbb{R}^2$ determines a point P by the same formula.

Let $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$. The distance between them is

$$d(P_1, P_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}. \tag{1.1.1}$$

Equation (1.1.1) is the Euclidean metric on $\mathbb{R}^2$. It satisfies the triangle inequality $d(P_1, P_3) \le d(P_1, P_2) + d(P_2, P_3)$, with equality if and only if P_2 lies on the segment $[P_1, P_3]$.

1.2 Lines and their equations

A line in the plane is the set of points satisfying a linear equation $ax + by = c$, $(a, b) \neq (0, 0)$. Two lines are parallel if their normal vectors are proportional, perpendicular if the dot product of their normal vectors vanishes.

1.3 Circles

A circle of radius $r > 0$ centred at (h, k) is the locus $(x - h)^2 + (y - k)^2 = r^2$. Completing the square in $x^2 + y^2 + Ax + By + C = 0$ decides whether it is a circle, a point, or the empty set.

1.4 Conic sections

The ellipse, parabola and hyperbola are the curves of second degree in two variables. Their canonical forms are $x^2/a^2 + y^2/b^2 = 1$, $y^2 = 4px$, and $x^2/a^2 - y^2/b^2 = 1$. Each admits a focal and a directrix characterisation, which we prove in Chapter 4.

Gmsh

Gmsh is a free 3D finite element grid generator with a built-in CAD engine and post-processing facilities. Gmsh aims at being the fastest and most light mesh generator, easy to install and easy to use. Gmsh accepts parameters from command line, text files and interactively from its graphical user interface. Gmsh uses its own ASCII file format by default, but can also read and write many other mesh formats.

Gmsh SDK

The Gmsh SDK provides a stable API to Gmsh's mesh generation and post-processing facilities. Gmsh's SDK can be used from the C++, C, Python, Julia and Lua APIs. The Python API is built on top of the C API, which is itself built on top of the C++ API. The Python API uses ctypes to call the C API functions, and does not require any compilation. The Julia API is built on top of the Lua API, which is itself built on top of the C API. The Lua API is built on top of the C++ API.

Python API

The Python API is distributed as a set of Python modules. The main module is `gmsh`, which defines the functions and classes of the Gmsh SDK. The Python API is built on top of the C API, which is itself built on top of the C++ API. The Python API uses ctypes to call the C API functions, and does not require any compilation.

§ 141.62 — Maximum contaminant levels (MCLs) for inorganic chemicals

Subpart G — National Primary Drinking Water Regulations

Part 141 — National Primary Drinking Water Regulations

Subchapter D — Public Water Systems

Chapter I — Environmental Protection Agency

Title 40 — Protection of Environment

(a) Maximum contaminant levels (MCLs) for inorganic chemicals. The following MCLs for inorganic chemicals, specified in milligrams per liter (mg/L), are the maximum permissible levels in water delivered to any user of a public water system. Compliance with these MCLs is determined by the analytical results obtained at the point of entry to the distribution system, as specified in subsequent sections of this part.

(1) Antimony — 0.006 mg/L.

(2) Arsenic — 0.010 mg/L. Effective date: January 23, 2006. Compliance with this MCL is required no later than January 23, 2006 for all public water systems.

(3) Asbestos — 7 million fibers per liter (MFL) (fibers longer than 10 micrometers).

(4) Barium — 2.0 mg/L.

(5) Beryllium — 0.004 mg/L.

(6) Cadmium — 0.005 mg/L.

(7) Chromium (total) — 0.100 mg/L.

(8) Cyanide (as free cyanide) — 0.200 mg/L.

(9) Fluoride — 4.0 mg/L. Secondary maximum contaminant level (SMCL): 2.0 mg/L.

(10) Mercury (inorganic) — 0.002 mg/L.

(11) Nitrate (as nitrogen) — 10.0 mg/L.

(12) Nitrite (as nitrogen) — 1.0 mg/L.

(13) Total nitrate and nitrite (as nitrogen) — 10.0 mg/L.

(14) Selenium — 0.050 mg/L.

(15) Thallium — 0.002 mg/L.

(b) Compliance. Compliance with the MCLs for inorganic chemicals is determined based on a running annual average at each sampling point. If the running annual average at any sampling point exceeds the MCL, the system is in violation. If any one sample would cause the running annual average to exceed the MCL, the system is in violation immediately.

(c) Reporting. Systems must report the results of inorganic chemical monitoring to the State within 10 days after the end of the month in which the results are received.

Subject: Cosmic Ray Shower Simulation

Author: Dr. Ashish Kumar Jha, Assistant Professor, Department of Physics, Government Degree College Kathua, Jammu and Kashmir, India

Abstract: This study presents a Cosmic Ray Shower Simulation, which models the interaction of high-energy cosmic rays with Earth's atmosphere. The simulation uses a Monte Carlo approach to model the random nature of particle interactions and decays, providing a probabilistic representation of the shower development. The simulation tracks the number of particles in the shower as it propagates through the atmosphere, and it calculates the shower's maximum size and the depth at which it occurs. The results of the simulation are compared with theoretical predictions and experimental data, demonstrating the accuracy and reliability of the simulation. The study also discusses the implications of the results for understanding the properties of cosmic rays and the Earth's atmosphere, and it suggests potential applications of the simulation in other fields, such as medical physics and radiation protection.

Introduction:
Cosmic rays are high-energy particles that originate from outer space and interact with the Earth's atmosphere, producing a cascade of secondary particles known as a cosmic ray shower. The study of cosmic ray showers is important for understanding the properties of cosmic rays and the Earth's atmosphere, and it has applications in fields such as medical physics and radiation protection. The simulation of cosmic ray showers is a challenging task, due to the complexity of the interactions and the random nature of the particle decays. The Monte Carlo approach is a powerful method for modeling the random nature of particle interactions and decays, and it has been used in many previous studies of cosmic ray showers. The results of the simulation are compared with theoretical predictions and experimental data, demonstrating the accuracy and reliability of the simulation. The study also discusses the implications of the results for understanding the properties of cosmic rays and the Earth's atmosphere, and it suggests potential applications of the simulation in other fields, such as medical physics and radiation protection.

Abstract

Is the Chinese Communist Party (CCP) an ideology or interest-led? We exploit the Chinese case to test the "ideology versus interest" hypothesis. We find that the CCP's ideology is more important than its interest in determining the allocation of resources. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the non-state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector.

Abstract: This study examines the impact of Ayushman Bharat on healthcare access and financial protection among rural households in Uttarakhand, India. Using a sample of 1,200 households across three districts, the study finds that the scheme has increased hospitalization rates by 18% and reduced out-of-pocket expenditure by an average of ₹4,200 per year. However, awareness remains low among the most vulnerable households, and implementation gaps in empanelled hospitals limit the scheme's reach in remote areas. The study concludes that while the scheme has made a significant contribution to rural healthcare, strengthening awareness and improving hospital empanelment are critical for its effectiveness.

Q1. Find $\int \frac{\sqrt{\tan x}}{\sin x \cos x}\,dx$

A1. Substitute $t = \sqrt{\tan x}$ to obtain $\int \frac{2t}{t^2 - 1}\,dt$.

Q2. Let $\{a_n\}_{n=1}^{\infty}$ be a sequence of real numbers satisfying $\lim_{n\to\infty} a_n = 0$. Prove that $\lim_{n\to\infty} \frac{a_1 + a_2 + \cdots + a_n}{n} = 0$.

A2. Let $\varepsilon > 0$ be arbitrary. Since $\lim_{n\to\infty} a_n = 0$, there exists $N_1 \in \mathbb{N}$ such that $|a_n| < \frac{\varepsilon}{2}$ for all $n \geq N_1$. Let $M = |a_1| + |a_2| + \cdots + |a_{N_1 - 1}|$. Choose $N_2 \in \mathbb{N}$ such that $N_2 > \frac{2M}{\varepsilon}$. Let $N = \max\{N_1, N_2\}$. Then for $n \geq N$, we have $\left|\frac{a_1 + a_2 + \cdots + a_n}{n}\right| \leq \frac{|a_1| + |a_2| + \cdots + |a_{N_1 - 1}|}{n} + \frac{|a_{N_1}| + |a_{N_1 + 1}| + \cdots + |a_n|}{n} < \frac{M}{N_2} + \frac{\varepsilon}{2} < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$.

Q3. Find $\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx$

A3.

$$\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx = \frac{\pi}{8}\log 2 + \int_0^1 \frac{\arctan x}{1+x}\,dx$$

Q4.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Q5. Let $f(x) = \sqrt{x}$ on $[0, 1]$. Show that f is uniformly continuous on $[0, 1]$ but not Lipschitz on $[0, 1]$.

A5. Uniform continuity follows from the fact that f is continuous on the compact interval $[0, 1]$. But f is not Lipschitz because $\frac{f(x) - f(0)}{x - 0} = \frac{\sqrt{x}}{x} = \frac{1}{\sqrt{x}} \to \infty$ as $x \to 0^+$.

Q6.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Q7. Let $f(x) = \sqrt{x}$ on $[0, 1]$. Show that f is uniformly continuous on $[0, 1]$ but not Lipschitz on $[0, 1]$.

Would you like me to also add a `clean-pycache` target to the **PHONY:** line, so it's recognized as a phony target? It's not strictly required, but it's a good practice.

Mixed-prec OPT-125M finetuning weird

Hi,

I have a weird issue. I'm finetuning OPT-125M using

```
python -m torch.distributed.run --nproc_per_node=8 --master_port=29500 train.py --model_name_or_path facebook/opt-125m --data_path ./alpaca_data.jsonl --bf16 True --output_dir ./out --num_train_epochs 3 \
    --per_device_train_batch_size 4 --gradient_accumulation_steps 8 --evaluation_strategy "no" --save_strategy "steps" --save_steps 2000 --save_total_limit 1 --learning_rate 2e-5 \
    --weight_decay 0. --warmup_ratio 0.03 --lr_scheduler_type "cosine" --logging_steps 1 --fsdp "full_shard auto_wrap" --fsdp_transformer_layer_cls_to_wrap "OPTDecoderLayer" --tf32 True
```

on 8 A100s. It runs fine for first epoch. However, starting in second epoch at step 20,000, the loss suddenly jumps higher and stays higher for the rest of the epoch. Normally, training loss decreases throughout epoch.

2.1. Comments, Identifiers and Keywords

2.1.1. Comments

Comments are used to describe the purpose of the code and to make it more readable. They are ignored by the compiler. There are two types of comments in C++: single-line comments and multi-line comments. Single-line comments begin with two slash characters (//) and extend to the end of the line. Multi-line comments begin with a slash and an asterisk (/*) and end with an asterisk and a slash (*/). Comments can be placed anywhere in the code, but they should not interrupt the syntax of other elements.

```
// This is a single-line comment
/* This is a multi-line comment
   spanning two lines */
```

```
int x = 5; // Initialize variable x
int y = 10; /* Initialize variable y */
```

2.1.2. Identifiers

Identifiers are used to name variables, functions, classes, and other objects. Rules for identifiers:

- Must begin with a letter or underscore (_).
- Can contain letters, digits, and underscores.
- Cannot be a keyword.
- Are case-sensitive (myVar and myvar are different).
- Should be descriptive and follow a consistent naming convention.

Example:

```
int myVar = 10;
int _temp = 20;
int count1 = 30;
int MyClass = 40;
```

2.1.3. Keywords

Keywords are reserved words that have special meaning in the compiler. Examples of keywords: int, char, float, if, else, while, for, class, public, private, return, true, false, nullptr, new, delete, try, catch, throw, const, static, extern, auto, sizeof, typedef, enum, struct, union, void, bool, and many others.

Example:

```
if (x > 0) {
    return true;
}
else {
    return false;
}
```

2.2. Data Types and Variables

2.2.1. Basic Data Types

C++ provides a variety of basic data types to store different kinds of data. Common basic data types include:

- int: Integer values.
- char: Single character.
- float: Floating-point numbers (single precision).
- double: Floating-point numbers (double precision).
- bool: Boolean values (true or false).
- void: Represents the absence of data.

Example:

```
int age = 25;
char grade = 'A';
float pi = 3.14159;
double distance = 1.23456789;
bool isStudent = true;
void* ptr = nullptr;
```

2.2.2. Variable Declaration and Initialization

Variables must be declared before they can be used. Declaration specifies the variable's data type and name.

Example:

```
int x;
int y = 10;
int z(20);
int a, b, c;
```

2.2.3. Constants

Constants are variables whose values cannot be changed after initialization. Use the const keyword.

Example:

```
const int MAX_SIZE = 100;
const double PI = 3.14159;
const char* const name = "John";
```

Ch. 2 Lect 2 Part 1 - Angular Velocity

Hi everyone,

In this video we will be talking about angular velocity. Let's start with a review of linear velocity. Remember, linear velocity is a vector. This vector points in the direction of motion and has units of m/s. Linear velocity can be calculated using the equation:

$$v = \frac{\Delta x}{\Delta t}$$

Now, let's talk about angular velocity.

Angular velocity is a vector that points in the direction of the axis of rotation. The magnitude of angular velocity is the rate of change of angular position. Angular velocity has units of rad/s. Angular velocity can be calculated using the equation:

$$\omega = \frac{\Delta \theta}{\Delta t}$$

Let's look at an example.

Suppose a wheel rotates from $\theta_1 = 0.5\ rad$ to $\theta_2 = 1.5\ rad$ in 2 seconds. What is the angular velocity of the wheel? Please write the answer in rad/s.

$$\omega = \frac{\Delta \theta}{\Delta t} = \frac{1.5\ rad - 0.5\ rad}{2\ s} = 0.5\ rad/s$$

1.1 Introduction to Signals and Systems

1.1.1 Signals

Signals are the information-bearing functions. Signals can be of one or more independent variables. We shall mostly be considering functions of time as the independent variable. Thus we shall be considering functions of one independent variable.

Signals can be classified as continuous-time signals, discrete-time signals, and mixed signals.

Continuous-time signals are defined for all values of the independent variable. Discrete-time signals are defined only for integer values of the independent variable. Mixed signals are defined for some values of the independent variable.

Signals can be classified as periodic or aperiodic signals. Periodic signals are defined by the relation $x(t) = x(t+T)$ for all t, where T is the period. Aperiodic signals are those signals that are not periodic.

Signals can be classified as even or odd signals. Even signals are those signals that satisfy $x(t) = x(-t)$. Odd signals are those signals that satisfy $x(t) = -x(-t)$.

Signals can be classified as energy signals or power signals. Energy signals are those signals for which the total energy is finite. Power signals are those signals for which the average power is finite.

$$E_x = \int_{-\infty}^{\infty} |x(t)|^2 \, dt$$

$$P_x = \lim_{T \to \infty} \frac{1}{2T} \int_{-T}^{T} |x(t)|^2 \, dt$$

1.1.2 Systems

Systems are the processors that operate on signals to produce other signals. Systems can be classified into various categories. Some of the categories are linear systems, time-invariant systems, causal systems, stable systems, memoryless systems, invertible systems, and so on.

A system is said to be linear if it satisfies the superposition principle. The superposition principle states that if $x_1(t) \to y_1(t)$ and $x_2(t) \to y_2(t)$, then $a x_1(t) + b x_2(t) \to a y_1(t) + b y_2(t)$.

A system is said to be time-invariant if a time shift in the input signal results in the same time shift in the output signal. Mathematically, if $x(t) \to y(t)$, then $x(t-t_0) \to y(t-t_0)$.

A system is said to be causal if the output at any time depends only on the present and past inputs. Mathematically, $y(t)$ depends only on $x(t)$ for $t \le t_0$.

A system is said to be stable if a bounded input produces a bounded output. Mathematically, if $|x(t)| \le M_x$, then $|y(t)| \le M_y$.

A system is said to be memoryless if the output at any time depends only on the input at that time. Mathematically, $y(t)$ depends only on $x(t)$.

A system is said to be invertible if there exists an inverse system that can recover the input from the output. Mathematically, if $x(t) \to y(t)$, then $y(t) \to x(t)$.

1.2 Signal Representation

1.2.1 Elementary Signals

Elementary signals are the building blocks of more complicated signals. Some of the elementary signals are the unit step function, the unit impulse function, the unit ramp function, the sinusoidal function, the exponential function, and so on.

The unit step function is defined as $u(t) = 1$ for $t \ge 0$ and $u(t) = 0$ for $t < 0$.

The unit impulse function is defined as $\delta(t) = 0$ for $t \ne 0$ and $\int_{-\infty}^{\infty} \delta(t) \, dt = 1$.

The unit ramp function is defined as $r(t) = t$ for $t \ge 0$ and $r(t) = 0$ for $t < 0$.

The sinusoidal function is defined as $x(t) = A \cos(\omega t + \phi)$, where A is the amplitude, ω is the angular frequency, and ϕ is the phase.

The exponential function is defined as $x(t) = e^{at}$, where a is a constant.

1.2.2 Representation of Signals

Signals can be represented in various ways. One of the ways is by using the unit impulse function. Any signal can be represented as a sum of shifted unit impulse functions.

Signals can also be represented in the frequency domain. The frequency domain representation of a signal is the Fourier transform of the signal.

Abstract: Ultrafast electrochemical intercalation underlies high-power electrochemical energy storage devices, such as supercapacitors. This intercalation is accompanied by phase transitions and strong electrostatic forces and is thought to be kinetically limited by ion diffusion. However, the intercalation kinetics and the underlying mechanisms are not well understood. Here, we develop a multiscale theory to study ultrafast electrochemical intercalation. We show that intercalation is not limited by diffusion but by the nucleation of new phases. We also show that the intercalation kinetics are governed by the electrostatic interactions between the intercalated ions and the host lattice. We further show that the electrostatic interactions can induce a phase transition from a disordered solid solution to a phase with ordered ion-vacancy layers, which further slows down the intercalation kinetics. We propose that the ordered ion-vacancy layers can be suppressed by tuning the electrostatic interactions, which we show can lead to ultrafast intercalation. Our theory provides a fundamental understanding of ultrafast electrochemical intercalation and suggests new strategies for the design of high-power electrodes.

1 Introduction

Ultrafast electrochemical intercalation is the key to high-power electrochemical energy storage devices, such as supercapacitors. This intercalation is accompanied by phase transitions and strong electrostatic forces and is thought to be kinetically limited by ion diffusion. However, the intercalation kinetics and the underlying mechanisms are not well understood. Here, we develop a multiscale theory to study ultrafast electrochemical intercalation. We show that intercalation is not limited by diffusion but by the nucleation of new phases. We also show that the intercalation kinetics are governed by the electrostatic interactions between the intercalated ions and the host lattice. We further show that the electrostatic interactions can induce a phase transition from a disordered solid solution to a phase with ordered ion-vacancy layers, which further slows down the intercalation kinetics. We propose that the ordered ion-vacancy layers can be suppressed by tuning the electrostatic interactions, which we show can lead to ultrafast intercalation. Our theory provides a fundamental understanding of ultrafast electrochemical intercalation and suggests new strategies for the design of high-power electrodes.

MR. TIGGY-WINKLE'S HOUSE

Mrs. Tiggy-winkle and her family washed and ironed,

and hung out clothes all the morning; and at

noon they sat down to a delicious dinner of roast chicken and green peas and new potatoes, and

custard pudding and strawberry tart. Afterwards they washed up the china and put it away in the

cupboard; and then they swept the house and dusted the furniture, and put the children to bed

before the kitchen fire.

Question Number : 1

Question Type : SINGLE

Question Stem : Let $f:[0,\infty)\to\mathbb{R}$ be a continuous function satisfying $f(x)=\int_0^x f(t)\,dt$. Then $f(x)$ is equal to

Choices :

(1) e^x

(2) e^x-1

(3) e^x+1

(4) $\frac{e^x}{2}$

Correct Answer : (2)

Solution : $f(x)=\int_0^x f(t)\,dt$ $\Rightarrow f'(x)=f(x)$ $\Rightarrow \frac{f'(x)}{f(x)}=1$ $\Rightarrow \int \frac{f'(x)}{f(x)}\,dx=\int 1\,dx$ $\Rightarrow \log_e f(x)=x+C$ $\Rightarrow f(x)=e^{x+C}$ $\Rightarrow f(x)=Ce^x$ $f(0)=\int_0^0 f(t)\,dt=0$ $\Rightarrow C=0$ $\Rightarrow f(x)=0$ $\Rightarrow f(x)=e^x-1$

Question Number : 2

Question Type : SINGLE

Choices :

(1) $\sqrt{2}+1$

(2) $\sqrt{2}-1$

(3) $\frac{1}{\sqrt{2}}$

(4) $\frac{1}{2}$

Correct Answer : (2)

Solution : $\int_0^1 \frac{dx}{\sqrt{1+x^2}}=\log_e(\sqrt{2}+1)$ $\int_0^1 \frac{x\,dx}{\sqrt{1+x^2}}=\sqrt{1+x^2}\Big|_0^1=\sqrt{2}-1$

Ultra-Low Power Cortex-M0+ Microcontroller Family Datasheet

Abstract

This document provides the electrical characteristics, pin assignments, and ordering information for the STM32L0x1 series of ultra-low power Cortex-M0+ microcontrollers. Operating from a single 1.65 V to 3.6 V supply, these devices integrate a 12-bit ADC, two comparators, and up to 51 I/O pins in packages from 20 to 64 pins. Typical run mode consumption is 150 µA/MHz and standby mode consumption is 0.9 µA with RTC and 8 KB RAM retention.

Author: Anna Kowalski, Technical Marketing Engineer, Microcontroller Division

1. Introduction

The STM32L0x1 family is a low-power, low-voltage extension of the STM32L0 series. It adds a second comparator and a 12-bit ADC to the base peripheral set, while retaining the same pin-to-pin compatible footer and ultra-low power architecture. Applications include battery-powered sensors, smart meters, and wearable devices.

1. Introduction

Knowledge distillation [Hinton et al., 2015] and weight initialization from pretrained models are two standard tools for accelerating training. Both rely on the assumption that the source and target networks share a similar architecture. When the architecture changes, these methods degrade rapidly.

We propose a method that aligns layer-level functional representations between two networks of arbitrary depth and width, then uses the alignment to initialize the target network. The method requires one forward pass over a probe dataset and no gradient computation beyond standard training.

2. Related Work

Knowledge distillation [Hinton et al., 2015] transfers knowledge from a teacher to a student by matching output distributions. FitNets [Romero et al., 2015] extends this to intermediate layers by matching hidden activations. Neither method addresses architecture mismatch.

Centered kernel alignment [Kornblith et al., 2019] measures representation similarity between layers. We use it as the alignment criterion.

Neural architecture search [Zoph and Le, 2017] automates architecture design. Our method does not search architectures; it assumes both are given.

3. Method

3.1 Probe Dataset

We select 512 samples from the validation set, stratified by class. Activations on this fixed set are recorded for both networks after each training epoch.

3.2 Correspondence Matrix

Let $A \in \mathbb{R}^{512 \times d_1}$ be the activations of source layer i and $B \in \mathbb{R}^{512 \times d_2}$ be the activations of target layer j. The alignment score is:

$$\mathrm{CKA}(A, B) = \frac{\mathrm{HSIC}(K_A, K_B)}{\sqrt{\mathrm{HSIC}(K_A, K_A)\,\mathrm{HSIC}(K_B, K_B)}}$$

where $K_A = AA^\top$ and $K_B = BB^\top$. The correspondence matrix $M \in \mathbb{R}^{L_1 \times L_2}$ is $M_{ij} = \mathrm{CKA}(A_i, B_j)$.

3.3 Initialization

Let $\pi(j) = \arg\max_i M_{ij}$ be the aligned source layer for target layer j. Initialize target layer j by copying weights from source layer $\pi(j)$, scaled by $M_{\pi(j),j}$:

$$W_j^{\text{target}} \leftarrow M_{\pi(j),j} \cdot W_{\pi(j)}^{\text{source}}$$

Layers with $M_{ij} < 0.3$ are initialized randomly. Biases are copied without scaling.

4. Experiments

4.1 Setup

Source: ResNet-18, 11.7M parameters. Target: ResNet-34, 21.8M parameters. Dataset: ImageNet-1k. Probe dataset: 512 samples, stratified by class. Optimizer: SGD, momentum 0.9, weight decay 10^{-4}. Cosine learning rate schedule, 10 epochs. Baseline: random initialization. Teacher-student baseline: FitNets [Romero et al., 2015], hint layer at conv3_x.

4.2 Results

Method	Top-1 acc. (%)	Top-5 acc. (%)
Random init.	68.2	88.1
Teacher-student	70.1	89.4
Proposed	71.4	90.2

Table 1. ImageNet-1k validation accuracy after 10 epochs. Mean over 3 runs.

4.3 Correspondence Matrix

Figure 1. Correspondence matrix M. Diagonal structure appears despite architecture mismatch.

5. Discussion

Limitations: Requires a probe dataset. Does not transfer optimizer state. Assumes both networks are trained on the same distribution.

Future work: Extend to transformer architectures. Combine with knowledge distillation. Study layer-wise learning rate schedules derived from M.

6. Conclusion

We aligned layers by functional similarity and initialized a deeper network from a shallower one. The method gains 3.2 top-1 points over random initialization and 1.3 points over a teacher-student baseline, at the cost of one forward pass over 512 samples.

EXHIBIT 10.1 — EXECUTIVE SUMMARY

Prepared for Meridian Capital Partners — Confidential — Prepared by Northwind Strategic Partners, Lead Author: Dr. Helena Vance

Section 1.

This document provides a concise, high-level overview of a proposed strategic partnership between Meridian Capital Partners and Northwind Strategic Partners. The purpose of this summary is to outline the core rationale, the proposed structure, and the next steps for exploring a potential joint venture in the mid-market consulting space. It is intended for the senior leadership teams of both firms to facilitate a preliminary discussion. It does not constitute a binding offer or commitment.

Section 2.

The mid-market consulting landscape is undergoing a period of significant consolidation. Private equity firms are acquiring specialized boutiques at a rate that has increased by approximately 40% over the last three years. This creates a unique opportunity for firms that can combine deep sector expertise with the operational scale required by institutional buyers. Meridian Capital Partners has a strong portfolio in industrial services and healthcare logistics, while Northwind Strategic Partners has a proprietary methodology for post-merger integration that has been applied to over 60 transactions in the last five years.

Section 3.

The proposed structure is a minority investment by Meridian Capital Partners in Northwind Strategic Partners, followed by a joint governance model for the first 24 months. This allows each firm to maintain its brand and client relationships while sharing data, talent, and deal flow. The initial investment would be in the range of $12 million to $18 million, subject to mutual due diligence. The exact figures will be determined by a third-party valuation agent. The goal is not to create a merged entity at this stage, but to build a shared platform that can be scaled if both parties agree it is mutually beneficial.

Section 4.

This document is a starting point for discussion. It does not commit either party to any action. The next step is a joint working session between the two leadership teams to review the detailed financial model and the proposed governance framework. We propose that this session be scheduled for the week of March 17, 2026. Please confirm your availability and we will circulate a calendar invite.

4.3 Differential Equations Governing Electrical Circuits

In this section we will derive some basic circuits, and we will show how to write down and solve the differential equations that govern their behaviour. Our circuits will contain only three elements: a resistor, an inductor, and a capacitor. We will assume that the resistance of the resistor is R ohms, the inductance of the inductor is L henrys, and the capacitance of the capacitor is C farads. We will also assume that the current in the circuit is $i(t)$ amperes, and that the voltage across the circuit is $v(t)$ volts.

Figure 4.3.1 Resistor, inductor, and capacitor in series with a voltage source

$$\begin{tikzcd} \bullet \arrow[r, "R"] & \bullet \arrow[r, "L"] & \bullet \arrow[r, "C"] & \bullet \arrow[d, "v(t)"] \\ & & & \bullet \arrow[l] \end{tikzcd}$$

4.3.1 Ohm's Law

Ohm's law states that the voltage across a resistor is proportional to the current through it. In symbols, we have

$$v_R(t) = R\,i(t).$$

4.3.2 Inductors

Faraday's law states that the voltage across an inductor is proportional to the rate of change of the current through it. In symbols, we have

$$v_L(t) = L\,\frac{di}{dt}(t).$$

4.3.3 Capacitors

The voltage across a capacitor is proportional to the charge on its plates. If $q(t)$ denotes the charge on the plates at time t, we have

$$v_C(t) = \frac{q(t)}{C}.$$

Since $i(t) = \frac{dq}{dt}(t)$, we can also write this relationship as

$$v_C(t) = \frac{1}{C}\int_{t_0}^{t} i(s)\,ds + v_C(t_0).$$

4.3.4 Kirchhoff's Voltage Law

Kirchhoff's voltage law states that the sum of the voltages around a closed loop is zero. In our circuit, this gives

$$v_R(t) + v_L(t) + v_C(t) = v(t).$$

Substituting the relations from 4.3.1–4.3.3, we obtain

$$R\,i(t) + L\,\frac{di}{dt}(t) + \frac{1}{C}\int_{t_0}^{t} i(s)\,ds + v_C(t_0) = v(t).$$

Differentiating once, we obtain the second-order equation

$$L\,\frac{d^2 i}{dt^2}(t) + R\,\frac{di}{dt}(t) + \frac{1}{C}\,i(t) = \frac{dv}{dt}(t).$$

4.3.5 Initial Conditions

Equation (4.3.5) is a second-order linear equation with constant coefficients. To solve it, we need two initial conditions. We have already specified $i(t_0)$ in the integral equation above; we must also specify $i'(t_0)$. Physically, $i'(t_0)$ is the rate of change of the current at the instant we begin our analysis, and it depends on the voltage and the current at that instant.

4.3.6 Example

Suppose $R = 2$ ohms, $L = 1$ henry, $C = 0.5$ farad, $v(t) = 10\cos t$, $i(0) = 0$, and $i'(0) = 0$. Then we have

$$i'' + 2i' + 2i = 10\cos t, \qquad i(0) = 0, \qquad i'(0) = 0.$$

We will solve this equation in Section 4.4.

Cross-Domain Transfer Learning for Industrial Fault Diagnosis Under Extreme Sample Imbalance

Abstract: Industrial fault diagnosis is hindered by the scarcity of labeled samples. This paper proposes a cross-domain transfer learning framework that combines a deep feature extractor with a domain-adversarial training scheme. The method achieves a macro-averaged F1 score of 0.9412 on a benchmark dataset with only 0.5% of the fault samples used for training, outperforming the best baseline by 0.0371. Ablation studies show that both components contribute significantly to the performance. The proposed framework is robust to different imbalance ratios and generalizes well to unseen fault types.

Abstract. This study estimates modal shift potential and co-benefits of dedicated cycle lane networks in four Indian cities using a stated preference survey of 2,340 respondents and a multinomial logit choice model. Results indicate that a continuous, protected cycle lane network could shift between 11 and 19 percent of motorised trips to cycling, depending on city size and existing cycling culture. Co-benefits include an estimated reduction of 0.4 million tonnes of CO2e annually and avoided congestion delay of 2.1 million person-hours per year. Sensitivity analysis shows that the shift is most responsive to perceived safety and network continuity, not to travel time alone. Implications for phased network planning are discussed.

Keywords: cycle lane, modal shift, stated preference, co-benefits, urban mobility, Indian cities, sustainable transport, multinomial logit, network planning, CO2e

1. Introduction

Urban transport in Indian cities is dominated by two-wheelers and motorised private vehicles, with cycling accounting for less than 2 percent of trips in most cities. Dedicated cycle lane networks are being rolled out in several cities under national and state programmes, but ex-ante evidence on how much ridership they can attract is thin. Decision-makers need estimates of modal shift potential before allocating road space, because the trade-off with motor vehicle lanes is visible and contested.

This study asks three questions. First, what modal shift potential do dedicated cycle lanes have in four Indian cities? Second, which attributes of the network drive choice, and how do they differ across cities? Third, what co-benefits in emissions and congestion delay would accompany the shift? The study uses a stated preference survey and a multinomial logit choice model to answer these questions.

2. Literature and Data

Prior Indian studies have mostly been case studies of single corridors. Cross-city evidence is rare. This study adds a four-city sample and tests whether the same attributes drive choice in different cultural contexts.

1.1 Review of Linear Algebra

1.1.1 Vector Spaces, Linear Independence, Dimension, Subspaces, Linear Maps and Matrices

Let K denote a field. Elements of K are called scalars.

Let V be a vector space over K. Elements of V are called vectors. Let $v_1, \ldots, v_n \in V$ be a set of vectors. Recall that $v_1, \ldots, v_n$ are linearly independent if $\sum_{i=1}^{n} \lambda_i v_i = 0$ implies $\lambda_1 = \ldots = \lambda_n = 0$. Recall that $v_1, \ldots, v_n$ are linearly dependent if there are $\lambda_1, \ldots, \lambda_n \in K$ not all zero such that $\sum_{i=1}^{n} \lambda_i v_i = 0$. Recall that $v_1, \ldots, v_n$ are a basis of V if they are linearly independent and $V = \mathrm{span}(v_1, \ldots, v_n)$. Recall that V is finite dimensional if it has a finite basis. Recall that $\dim V = n$ if V has a basis of n elements.

Let W be a subspace of V. Recall that $\dim W \leq \dim V$. Recall that $\dim W = \dim V$ if and only if $W = V$.

Let W be another vector space over K. Recall that a map $f : V \to W$ is linear if $f(\lambda v + \mu w) = \lambda f(v) + \mu f(w)$ for all $v, w \in V$ and $\lambda, \mu \in K$.

Let $f : V \to W$ be linear. Recall that $\mathrm{Im}(f) = \{f(v) \mid v \in V\}$ and $\mathrm{Ker}(f) = \{v \in V \mid f(v) = 0\}$ are subspaces of W and V respectively. Recall that f is injective if and only if $\mathrm{Ker}(f) = 0$. Recall that f is surjective if and only if $\mathrm{Im}(f) = W$. Recall that f is bijective if and only if $\mathrm{Ker}(f) = 0$ and $\mathrm{Im}(f) = W$.

Let $v_1, \ldots, v_n$ be a basis of V. Let $w_1, \ldots, w_n \in W$ be any vectors. Then there exists a unique linear map $f : V \to W$ such that $f(v_i) = w_i$ for $i = 1, \ldots, n$.

Let $v_1, \ldots, v_n$ be a basis of V. Let $w_1, \ldots, w_m$ be a basis of W. Let $f : V \to W$ be linear. Then f is uniquely determined by the $m \times n$ matrix $A = (a_{ij})$ with entries $a_{ij} \in K$ such that $f(v_j) = \sum_{i=1}^{m} a_{ij} w_i$ for $j = 1, \ldots, n$.

Conversely, given any $m \times n$ matrix $A = (a_{ij})$ with entries $a_{ij} \in K$, there exists a linear map $f : V \to W$ such that $f(v_j) = \sum_{i=1}^{m} a_{ij} w_i$ for $j = 1, \ldots, n$.

Let $v_1, \ldots, v_n$ be a basis of V. Let $w_1, \ldots, w_m$ be a basis of W. Let $f : V \to W$ be linear. Let $A = (a_{ij})$ be the matrix of f with respect to the bases $v_1, \ldots, v_n$ and $w_1, \ldots, w_m$. Let $v = \sum_{j=1}^{n} \lambda_j v_j$ be a vector in V. Then $f(v) = \sum_{i=1}^{m} \mu_i w_i$ where $\mu_i = \sum_{j=1}^{n} a_{ij} \lambda_j$ for $i = 1, \ldots, m$.

Let $v_1, \ldots, v_n$ be a basis of V. Let $w_1, \ldots, w_m$ be a basis of W. Let $f : V \to W$ be linear. Let $A = (a_{ij})$ be the matrix of f with respect to the bases $v_1, \ldots, v_n$ and $w_1, \ldots, w_m$. Let $B = (b_{jk})$ be the matrix of f with respect to the bases $v_1, \ldots, v_n$ and $w_1, \ldots, w_m$. Then $A = B

1.1.1 Mind Mapping Matrix: Core Concepts & Applications, Cognitive Science Foundations, and Tools

1.1.1.1 Mind Mapping Matrix: Core Concepts & Applications

1.1.1.1.1 Mind Mapping Matrix: Core Concepts

Mind mapping matrix, rooted in the foundational principles of mind mapping, leverages the inherent power of visual thinking to organize information, stimulate creativity, and facilitate problem solving. The matrix approach, however, introduces a structured framework that enhances the flexibility and adaptability of traditional mind maps. Instead of a single central topic, the matrix allows for multiple interconnected topics, each with its own branches and sub-branches. This multi-dimensional structure allows for the exploration of complex relationships between different ideas and concepts, fostering a more comprehensive understanding of the subject matter.

Lab 2 Part 1 is the first half of a two-part capstone. You will take a single-page personal site from a fixed-width, mouse-only layout to a fluid, keyboard-friendly, screen-reader-friendly page that holds up on a phone and passes a basic accessibility check. Part 2 adds a dark mode and a contact form on top of this foundation.

Lab 2 Part 1 is the first half of a two-part capstone. You will take a single-page personal site from a fixed-width, mouse-only layout to a fluid, keyboard-friendly, screen-reader-friendly page that holds up on a phone and passes a basic accessibility check. Part 2 adds a dark mode and a contact form on top of this foundation.

## Contents

1. Starter HTML
2. Fluid layout with CSS Grid and Flexbox
3. Responsive typography and spacing
4. Semantic HTML and landmarks
5. Keyboard navigation and focus states
6. Alt text and screen reader basics
7. Contrast and color
8. Submission checklist

## 1. Starter HTML

Save the following as `index.html` and open it in a browser. It works, but it looks and behaves like a page from 1995. Your job is to make it fluid, readable, and usable.

Abstract

This paper presents a novel approach for learning visuomotor policies for robotic manipulation tasks using Proximal Policy Optimization (PPO) with sparse rewards. We demonstrate that a simple reward structure combined with carefully designed observation spaces and action spaces can enable a robot to learn complex manipulation behaviors from scratch in simulation. We evaluate our approach on a variety of manipulation tasks including reaching, pushing, and pick-and-place in a simulated environment. The results show that our method achieves high success rates and exhibits robust performance across different initial conditions.

1. Introduction

Reinforcement learning (RL) has emerged as a powerful tool for enabling robots to learn complex behaviors from interaction with their environment. Recent advances in deep RL have demonstrated impressive results in various domains, including robotic manipulation. However, most of these approaches rely on dense reward functions or require extensive human demonstrations to guide the learning process.

In this paper, we propose a simple approach for learning visuomotor policies for robotic manipulation using PPO with sparse rewards. The key insight is that with carefully designed observation spaces and action spaces, even a simple reward structure can enable the robot to learn complex manipulation behaviors from scratch. We evaluate our approach on a variety of manipulation tasks in a simulated environment and show that our method achieves high success rates and exhibits robust performance across different initial conditions.

2. Related Work

2.1. Reinforcement Learning for Robotic Manipulation

Reinforcement learning has been applied to various robotic manipulation tasks, including grasping, pushing, and assembly. Most of these approaches rely on dense reward functions or require extensive human demonstrations to guide the learning process. In contrast, our approach uses sparse rewards and does not require any human demonstrations.

2.2. Sparse Rewards

Sparse rewards are a challenging setting for reinforcement learning, as the agent receives feedback only when it achieves the goal. Several approaches have been proposed to address this challenge, including hindsight experience replay (HER) [Andrychowicz et al., 2017], curriculum learning [Bengio et al., 2009], and intrinsic motivation [Pathak et al., 2017]. In this paper, we show that with carefully designed observation spaces and action spaces, even a simple reward structure can enable the robot to learn complex manipulation behaviors from scratch.

3. Problem Formulation

We consider a robot manipulator with a gripper. The robot's state consists of the joint angles and velocities of the arm, the gripper state, and the position of the object to be manipulated. The robot's action consists of the joint velocities of the arm and the gripper state. The goal is to learn a policy that maps the robot's state to its action such that the robot can manipulate the object to a desired goal position.

4. Method

4.1. Observation Space

The observation space consists of the joint angles and velocities of the arm, the gripper state, and the position of the object to be manipulated. The joint angles and velocities are normalized to the range [-1, 1]. The gripper state is a binary variable indicating whether the gripper is open or closed. The object position is represented in the robot's coordinate frame.

4.2. Action Space

The action space consists of the joint velocities of the arm and the gripper state. The joint velocities are normalized to the range [-1, 1]. The gripper state is a binary variable indicating whether the gripper should be open or closed.

4.3. Reward Function

We use a sparse reward function that gives a reward of 1 when the object is within a small distance of the goal position and 0 otherwise. Formally, the reward function is:

$$r(s, a) = \begin{cases} 1 & \text{if } \|p_{obj} - p_{goal}\| < \epsilon \\ 0 & \text{otherwise} \end{cases}$$

where p_{obj} is the position of the object, p_{goal} is the goal position, and ϵ is a small threshold (we use $\epsilon = 0.05$ meters).

4.4. Proximal Policy Optimization

We use Proximal Policy Optimization (PPO) [Schulman et al., 2017] to learn the policy. PPO is a policy gradient method that optimizes a clipped surrogate objective function to prevent large updates to the policy. The objective function is:

$$L^{CLIP}(\theta) = \mathbb{E}_t[\min(r_t(\theta)A_t, \text{clip}(r_t(\theta), 1-\epsilon, 1+\epsilon)A_t)]$$

where $r_t(\theta) = \frac{\pi_\theta(a_t|s_t)}{\pi_{\theta_{old}}(a_t|s_t)}$ is the probability ratio between the new policy and the old policy, A_t is the advantage function, and ϵ is a hyperparameter (we use $\epsilon = 0.2$).

5. Experiments

5.1. Environment

We evaluate our approach in a simulated environment using the MuJoCo physics engine. The robot is a 7-DOF manipulator with a parallel jaw gripper. The object is a cube with a side length of 5 cm. The workspace is a table of size 1 m × 1 m. The robot's base is fixed to the table. The robot's state consists of the joint angles and velocities of the arm, the gripper state, and the position of the object to be manipulated. The robot's action consists of the joint velocities of the arm and the gripper state. The goal is to learn a policy that maps the robot's state to its action such that the robot can manipulate the object to a desired goal position.

5.2. Tasks

We evaluate our approach on three tasks: reaching, pushing, and pick-and-place. In the reaching task, the robot must move its gripper to a random goal position. In the pushing task, the robot must push the object to a random goal position. In the pick-and-place task, the robot must pick up the object and place it at a random goal position. The goal position is randomly sampled from a uniform distribution over the workspace.

5.3. Results

We train a policy for each task using PPO with sparse rewards. The policy is represented by a neural network with two hidden layers of size 256 and 256. The activation function is tanh. The policy is trained for 1 million timesteps. We evaluate the policy every 10 thousand timesteps by running 100 episodes and computing the success rate. The success rate is the fraction of episodes in which the object is within a small distance of the goal position at the end of the episode.

Figure 1. Success rate vs. timesteps for the reaching, pushing, and pick-and-place tasks. The success rate is the fraction of episodes in which the object is within a small distance of the goal position at the end of the episode. The curves are averaged over 5 random seeds. The shaded regions indicate the standard deviation.

6. Conclusion

We propose a simple approach for learning visuomotor policies for robotic manipulation using PPO with sparse rewards. We demonstrate that with carefully designed observation spaces and action spaces, even a simple reward structure can enable the robot to learn complex manipulation behaviors from scratch. We evaluate our approach on a variety of manipulation tasks in a simulated environment and show that our method achieves high success rates and exhibits robust performance across different initial conditions.

(a) Trial Balance is a statement prepared with the purpose of ascertaining the accuracy of the ledger accounts. It is a list of all ledger accounts with their closing balances. It shows the total of all debit balances and the total of all credit balances. If both the totals are equal, it shows that the ledger accounts are arithmetically correct.

Trial Balance is prepared on the basis of ledger accounts.

MR-TIGER-MAGNETOSCOPY

Magnetoscopy of MR-TIGER-Image series

Author

Mark Ziegler, Christian Stumpp, Jan Ehrhardt

Abstract

Magnetic resonance in a tissue-like phantom mirrors the tissue's magnetic properties. Magnetoscopy is a method to reconstruct these properties from MR-TIGER-Image series. We show how to derive the magnetic susceptibility from a single MR-TIGER-Image series.

Abstract—We propose Dex-Net 4.0, a family of robust, sample-efficient, and high-speed robust grasping policies for parallel-jaw and suction-cup robots. We define a new class of stochastic, parameterized grasp quality functions and combine them in a new formulation for the cross-entropy method (CEM) that plans robust grasps under a Gaussian Mixture Model (GMM) of 3D point cloud observations. We train the GMMs in simulation using over 5.5 million point cloud and grasp pairs from 3,000 3D models and 10,000 2D images. We evaluate the resulting policies in 2,000 physical trials for bin picking of 50 novel singulated objects with a Fanuc M-1iA/3.5L robot and a Photoneo PhoxiNeo-25M-CL-IR stereo camera. Results suggest that the policies can plan robust grasps with both parallel-jaw and suction-cup grippers in 0.5 seconds on average with a 95% success rate for parallel-jaw grasps and a 85% success rate for suction-cup grasps. Supplement, code, and videos are at http://bit.ly/dex-net-4-0.

Abstract
Customer-firm relationships are a fundamental aspect of marketing. Although the literature has provided a wealth of knowledge about how customers form, maintain, and dissolve relationships with firms, it has paid less attention to how firms form, maintain, and dissolve relationships with customers. This article proposes a conceptual model of the antecedents and consequences of firm-initiated customer-firm relationship dissolution. The model suggests that firm-initiated customer-firm relationship dissolution is a function of customer-firm relationship quality, customer-firm relationship value, and customer-firm relationship strength. The model also suggests that firm-initiated customer-firm relationship dissolution has a negative impact on customer-firm relationship quality, customer-firm relationship value, and customer-firm relationship strength. Finally, the model suggests that firm-initiated customer-firm relationship dissolution has a positive impact on customer-firm relationship dissolution. Implications for theory and practice are discussed.
