Gnuplot is a command-line driven interactive function plotting program. Originally intended as a means to stimulate students' interest in mathematics, it has been used in scientific fields for over a decade. Gnuplot is capable of plotting 2D functions and data in various styles, and 3D functions and data in the form of surfaces and contour maps. Gnuplot can output to a variety of formats, including PostScript, PNG, and SVG.

Gnuplot is a portable command-line driven interactive data and function plotting utility for UNIX, IBM OS/2, MS Windows, DOS, and many other platforms. It was originally intended for students to explore mathematical functions and data in a friendly way, but has been used for many scientific and engineering applications since then. Gnuplot supports many types of plots in either 2D or 3D. It can plot functions and data read from ASCII files. Gnuplot can output to a variety of formats, including PNG, PostScript, and SVG.

Abstract: Recent advances in deep learning have made it possible to generate photo-realistic images by using neural networks and adversarial training. However, most existing studies are confined to synthetic datasets with a small number of images, and a recent study reveals that the performance of GANs trained on more complex datasets with multi-modal distributions still leaves significant room for improvement. In this paper, we propose the Self-Attention GAN (SAGAN) which allows attention-driven, long-range dependency modeling for image generation tasks. We show that self-attention is complementary to convolutions and helps both the generator and the discriminator to model long-range dependencies. Furthermore, we propose the Frechet Inception Distance (FID) and the Inception Score (IS) to evaluate the quality of the generated images. We visualize the attention layers learned by our generator, and we show that our SAGAN achieves the state-of-the-art results by a large margin in the challenging ImageNet dataset.

東京都内の公園ベンチ設置状況調査報告書

1. 調査概要

調査対象は、東京都内の公園に設置されているベンチ（以下「ベンチ」）である。本調査は、ベンチの設置場所、種類、材質、座面の高さ、背もたれの有無、経過年数、および利用者からの苦情の有無を網羅的に把握することを目的とした。調査期間は2025年4月1日から2025年8月31日までであり、対象公園は23区内の都立公園および区立公園の合計412公園である。

2. 調査方法

現地調査は、調査員2名が1公園あたり平均3.5時間を目安に巡回し、ベンチの有無を確認した上で、1台ずつ写真を撮影し、所定の調査票に記入した。座面の高さは、メジャーを用いて地面から座面までの垂直距離を0.5cm単位で計測した。材質は、目視および触診により、木材、金属、樹脂、コンクリートの4区分に分類した。苦情の有無については、公園管理事務所に過去1年間に寄せられた苦情記録を照合した。

3. 調査結果

3.1 設置台数

412公園で合計1,847台のベンチが確認された。1公園あたりの平均設置台数は4.48台であった。最も多かったのは台東区の上野恩賜公園で38台、最も少なかったのは3台であった。ベンチを設置していない公園は7公園であった。

3.2 材質別内訳

材質	台数	構成比
木材	1,109	60.0%
金属	461	25.0%
樹脂	277	15.0%
コンクリート	0	0.0%

3.3 座面の高さ

座面の高さの平均値は43.2cmであった。最頻値は45cmであり、JIS S 1021 の推奨値（40cm）を3cm上回る。

```
# 座面高さ分布（cm）
import matplotlib.pyplot as plt
plt.hist(seat_height, bins=8)
plt.savefig('seat_height.png')
```

3.4 経過年数

経過年数の平均は6.7年であった。最も古いベンチは1974年設置とされ、50年経過していた。

3.5 苦情の有無

苦情記録のあるベンチは312台であった。内訳は、座面が硬い、背もたれがない、ささくれがある、の順であった。

4. 考察

木材が60%を占めるが、経年劣化による苦情は木材に集中する傾向がある。

5. 結論

本調査により、東京都内の公園ベンチの設置状況を網羅的に把握した。

$$\begin{aligned} &\text{Period 1:} \quad \text{Period 2:} \\ &\text{Consumption} \quad c_1 \quad c_2 \\ &\text{Production} \quad y_1 \quad y_2 \end{aligned}$$

Suppose that consumption is strictly increasing and concave.

"But I must explain to you how all this mistaken idea of denouncing pleasure and praising pain was born and I will give you a complete account of the system, and expound the actual teachings of the great explorer of the truth, the master-builder of human happiness. No one rejects, dislikes, or avoids pleasure itself, because it is pleasure, but because those who do not know how to pursue pleasure rationally encounter consequences that are extremely painful. Nor again is there anyone who loves or pursues or desires to obtain pain of itself, because it is pain, but because occasionally circumstances occur in which toil and pain can procure him some great pleasure. To take a trivial example, which of us ever undertakes laborious physical exercise, except to obtain some advantage from it? But who has any right to find fault with a man who chooses to enjoy a pleasure that has no annoying consequences, or one who avoids a pain that produces no resultant pleasure?"

이사회 의장 주주 제안서

제1조 (제안의 목적)

제1조 (제안의 목적) 본 제안서는 주주 김지훈이 이사회 의장 선임을 제안하기 위해 작성되었다. 의장 선임은 이사회 운영 전반에 대한 주주 권리 행사의 가장 직접적인 수단이다. 의장은 의제 설정, 회의 진행, 의결 정리, 이사회 의사록 작성 등 이사회 운영 전반에 대한 권한을 가진다. 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 이사 선임 제안은 시간이 걸리지만, 의장 선임은 다음 이사회 한 번이면 된다.

제2조 (의장 선임 제안의 근거)

제2조 (의장 선임 제안의 근거) 의장 선임 제안은 세 가지 근거에 기한다. 첫째, 현 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다. 둘째, 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 셋째, 의장은 의제 설정, 회의 진행, 의결 정리, 이사회 의사록 작성 등 이사회 운영 전반에 대한 권한을 가진다.

제3조 (의사록 미작성 사실)

제3조 (의사록 미작성 사실) 2024년 3월 이사회 의사록 미작성 사실은 이사회 의사록 작성 의무를 지키지 않았다는 것을 보여준다. 의사록 작성 의무는 이사회 의장의 의무다. 의사록 미작성 사실은 의장 김민수가 이사회 의사록 작성 의무를 지키지 않았다는 것을 보여준다.

제4조 (의장 김민수의 의사록 작성 의무 불이행)

제4조 (의장 김민수의 의사록 작성 의무 불이행) 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다. 의사록 작성 의무는 이사회 의장의 의무다. 의장 김민수는 이사회 의사록 작성 의무를 지키지 않았다.

제5조 (의장 선임 제안의 효과)

제5조 (의장 선임 제안의 효과) 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다. 이사 선임 제안은 시간이 걸리지만, 의장 선임은 다음 이사회 한 번이면 된다. 의장 선임 제안은 이사회 구성 변경 없이 이사회 운영 방식을 바꾸는 가장 빠른 경로다.

1.1 Overview of Operating Systems

Operating systems are a vital part of any computer system. We plan to devote a few chapters to this important topic. This chapter provides an overview of the rest of the chapters in this book.

1.2 Multiprocessor Systems

Most of the discussion in this book is devoted to systems that have only one CPU. In the near future, however, most computer systems will be organized around multiple CPUs. There are several reasons for building such multiprocessor systems, with the three most prominent being increased throughput, economy of scale, and increased reliability. Multiprocessor systems can be classified as multiprocessor systems, symmetric multiprocessor systems, and clustered systems. We discuss these types of multiprocessor systems in the following sections.

1.2.1 Multiprocessor Systems

Multiprocessor systems, also known as parallel systems, tightly coupled systems, and multicore systems, have more than one processor in close communication, sharing the computer bus, the memory, and peripheral devices. Multiprocessor systems have three main advantages:

1. Increased throughput. By increasing the number of processors, we expect to get more work done in less time. However, the speed-up ratio with N processors is not N, however, it is less than N. When multiple processors cooperate on a task, a certain amount of overhead is incurred in keeping all the parts working correctly. This overhead, plus contention for shared resources, lowers the expected gain from additional processors. Another reason for multiprocessor systems to exist is that a collection of processors can provide greater throughput than a single processor can.
2. Economy of scale. Multiprocessor systems can cost less than equivalent multiple single-processor systems, because they can share peripherals, mass storage, and power supplies. If several programs operate on the same set of data, it is cheaper to store those data on one disk and have all the processors share it, than to have many computers with local disks and many copies of the data.
3. Increased reliability. If functions can be distributed properly among several processors, then the failure of one processor will not halt the system, only slow it down. If we have ten processors and one fails, then each of the remaining nine processors must be able to handle a share of the work of the failed processor. Overall, the system may be 10 percent slower, yet it can still perform the work of the failed processor.

Topic:

Question:

Find a unit tangent vector to the curve $r(t) = \langle \sin(t), \cos(t), \sqrt{2}t \rangle$ at the point $(0, 1, \pi\sqrt{2}/4)$.

Solution:

Step 1: Find the derivative $r'(t)$ of the position vector $r(t)$.

$$r'(t) = \langle \cos(t), -\sin(t), \sqrt{2} \rangle$$

Step 2: Evaluate $r'(t)$ at the point $t = \pi/4$ (since $\sin(\pi/4) = \cos(\pi/4) = 1/\sqrt{2}$).

$$r'(\pi/4) = \langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle$$

Step 3: Find the magnitude of $r'(\pi/4)$.

$$|r'(\pi/4)| = \sqrt{(1/\sqrt{2})^2 + (-1/\sqrt{2})^2 + (\sqrt{2})^2} = \sqrt{1/2 + 1/2 + 2} = \sqrt{3}$$

Step 4: Divide $r'(\pi/4)$ by its magnitude to find the unit tangent vector.

$$T(\pi/4) = \frac{r'(\pi/4)}{|r'(\pi/4)|} = \frac{\langle 1/\sqrt{2}, -1/\sqrt{2}, \sqrt{2} \rangle}{\sqrt{3}} = \langle 1/\sqrt{6}, -1/\sqrt{6}, \sqrt{2/3} \rangle$$

Step 5: Rationalize the denominators.

$$T(\pi/4) = \langle \sqrt{6}/6, -\sqrt{6}/6, \sqrt{6}/3 \rangle$$

Step 6: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 7: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 8: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 9: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 10: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 11: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 12: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 13: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 14: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 15: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 16: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 17: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 18: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

Step 19: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 20: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 22: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

$$r(\pi/4) = \langle \sin(\pi/4), \cos(\pi/4), \sqrt{2}\pi/4 \rangle = \langle 1/\sqrt{2}, 1/\sqrt{2}, \pi\sqrt{2}/4 \rangle$$

Step 23: Verify the unit tangent vector.

$$|T(\pi/4)| = \sqrt{(\sqrt{6}/6)^2 + (-\sqrt{6}/6)^2 + (\sqrt{6}/3)^2} = \sqrt{1/6 + 1/6 + 2/3} = \sqrt{1} = 1$$

Step 24: Check the point $(0, 1, \pi\sqrt{2}/4)$ is on the curve.

1.1 Sets and Subsets

Definition 1.1.1 (Set)

A set is a collection of distinct objects.

Notation 1.1.2

We write $x \in S$ to mean that x belongs to S and $x \notin S$ to mean that x does not belong to S. We write $\{x : P(x)\}$ for the set of all x satisfying the property $P(x)$. We denote the empty set by $\emptyset$. We denote the set of natural numbers by $\mathbb{N}$, the set of integers by $\mathbb{Z}$, the set of rational numbers by $\mathbb{Q}$, the set of real numbers by $\mathbb{R}$, and the set of complex numbers by $\mathbb{C}$. We denote the set of positive integers by $\mathbb{Z}^+$, the set of positive real numbers by $\mathbb{R}^+$, and the set of non-zero real numbers by $\mathbb{R}^*$.

Definition 1.1.3 (Subset)

Let S and T be sets. We say S is a subset of T and write $S \subseteq T$ if every element of S is also an element of T. We say S is a proper subset of T and write $S \subset T$ if $S \subseteq T$ and $S \neq T$.

Notation 1.1.4

We write $S \not\subseteq T$ to mean that S is not a subset of T.

Theorem 1.1.5 (Properties of Subsets)

Let S, T, and U be sets. Then:

(a) $\emptyset \subseteq S$ for any set S.

(b) $S \subseteq S$ for any set S.

(c) If $S \subseteq T$ and $T \subseteq U$, then $S \subseteq U$.

(d) If $S \subset T$ and $T \subset U$, then $S \subset U$.

(e) If $S \subset T$ and $T \subseteq U$, then $S \subset U$.

(f) If $S \subseteq T$ and $T \subset U$, then $S \subset U$.

Proof

(a) Let $x \in \emptyset$. Then $x \in S$ because there are no elements in $\emptyset$. Thus $\emptyset \subseteq S$.

(b) Let $x \in S$. Then $x \in S$. Thus $S \subseteq S$.

(c) Let $x \in S$. Then $x \in T$ because $S \subseteq T$. Then $x \in U$ because $T \subseteq U$. Thus $S \subseteq U$.

(d) Let $x \in S$. Then $x \in T$ because $S \subset T$. Then $x \in U$ because $T \subset U$. Thus $S \subset U$.

(e) Let $x \in S$. Then $x \in T$ because $S \subset T$. Then $x \in U$ because $T \subseteq U$. Thus $S \subset U$.

(f) Let $x \in S$. Then $x \in T$ because $S \subseteq T$. Then $x \in U$ because $T \subset U$. Thus $S \subset U$.

Theorem 1.1.6 (Equality of Sets)

Let S and T be sets. Then $S = T$ if and only if $S \subseteq T$ and $T \subseteq S$.

Proof

Let S and T be sets. Suppose $S = T$. Then $S \subseteq T$ and $T \subseteq S$. Conversely, suppose $S \subseteq T$ and $T \subseteq S$. Let $x \in S$. Then $x \in T$ because $S \subseteq T$. Let $x \in T$. Then $x \in S$ because $T \subseteq S$. Thus $S = T$.

Theorem 1.1.7 (Cardinality of Finite Sets)

Let S be a finite set. Then $|S|$ is the number of elements in S. Let S and T be finite sets. Then:

(a) $|S| = 0$ if and only if $S = \emptyset$.

(b) $|S| = 1$ if and only if $S = \{x\}$ for some x.

(c) $|S| = |T|$ if and only if there exists a bijection $f : S \to T$.

(d) If $S \subseteq T$, then $|S| \leq |T|$.

(e) If $S \subset T$, then $|S| < |T|$.

(f) $|S \cup T| = |S| + |T| - |S \cap T|$.

(g) $|S \times T| = |S| \cdot |T|$.

(h) $|S^T| = |S|^{|T|}$.

(i) $|\mathcal{P}(S)| = 2^{|S|}$.

Proof

(a) $|S| = 0$ if and only if there are no elements in S if and only if $S = \emptyset$.

(b) $|S| = 1$ if and only if $S = \{x\}$ for some x because there is exactly one element in S.

(c) $|S| = |T|$ if and only if there exists a bijection $f : S \to T$ because the cardinality of a finite set is the number of elements in the set.

(d) If $S \subseteq T$, then $|S| \leq |T|$ because S is a subset of T and the cardinality of a finite set is the number of elements in the set.

(e) If $S \subset T$, then $|S| < |T|$ because S is a proper subset of T and the cardinality of a finite set is the number of elements in the set.

(f) $|S \cup T| = |S| + |T| - |S \cap T|$ because the number of elements in $S \cup T$ is the number of elements in S plus the number of elements in T minus the number of elements in $S \cap T$.

(g) $|S \times T| = |S| \cdot |T|$ because the number of elements in $S \times T$ is the number of elements in S times the number of elements in T.

(h) $|S^T| = |S|^{|T|}$ because the number of elements in S^T is the number of elements in S raised to the power of the number of elements in T.

(i) $|\mathcal{P}(S)| = 2^{|S|}$ because the number of elements in $\mathcal{P}(S)$ is 2 raised to the power of the number of elements in S.

Theorem 1.1.8 (Properties of Intersection)

Let S, T, and U be sets. Then:

(a) $S \cap T = T \cap S$.

(b) $S \cap (T \cap U) = (S \cap T) \cap U$.

(c) $S \cap S = S$.

(d) $S \cap \emptyset = \emptyset$.

(e) $S \cap T \subseteq S$.

(f) $S \cap T \subseteq T$.

(g) $S \cap T = S$ if and only if $S \subseteq T$.

(h) $S \cap T = \emptyset$ if and only if S and T are disjoint.

Proof

(a) $S \cap T = T \cap S$ because $x \in S \cap T$ if and only if $x \in S$ and $x \in T$ if and only if $x \in T$ and $x \in S$ if and only if $x \in T \cap S$.

(b) $S \cap (T \cap U) = (S \cap T) \cap U$ because $x \in S \cap (T \cap U)$ if and only if $x \in S$ and $x \in T \cap U$ if and only if $x \in S$ and $x \in T$ and $x \in U$ if and only if $x \in (S \cap T) \cap U$.

(c) $S \cap S = S$ because $x \in S \cap S$ if and only if $x \in S$ and $x \in S$ if and only if $x \in S$.

(d) $S \cap \emptyset = \emptyset$ because there are no elements in $\emptyset$.

(e) $S \cap T \subseteq S$ because $x \in S \cap T$ if and only if $x \in S$ and $x \in T$ if and only if $x \in S$.

(f) $S \cap T \subseteq T$ because $x \in S \cap T$ if and only if $x \in S$ and $x \in T$ if and only if $x \in T$.

(g) $S \cap T = S$ if and only if $S \subseteq T$ because $S \cap T = S$ if and only if $S \subseteq T$ and $T \subseteq S$ if and only if $S \subseteq T$.

(h) $S \cap T = \emptyset$ if and only if S and T are disjoint because there are no elements in $S \cap T$ if and only if there are no elements in S and T if and only if S and T are disjoint.

Theorem 1.1.9 (Properties of Union)

Let S, T, and U be sets. Then:

(a) $S \cup T = T \cup S$.

(b) $S \cup (T \cup U) = (S \cup T) \cup U$.

(c) $S \cup S = S$.

(d) $S \cup \emptyset = S$.

(e) $S \subseteq S \cup T$.

(f) $T \subseteq S \cup T$.

(g) $S \cup T = S$ if and only if $T \subseteq S$.

(h) $S \cup T = T$ if and only if $S \subseteq T$.

Proof

(a) $S \cup T = T \cup S$ because $x \in S \cup T$ if and only if $x \in S$ or $x \in T$ if and only if $x \in T$ or $x \in S$ if and only if $x \in T \cup S$.

(b) $S \cup (T \cup U) = (S \cup T) \cup U$ because $x \in S \cup (T \cup U)$ if and only if $x \in S$ or $x \in T \cup U$ if and only if $x \in S$ or $x \in T$ or $x \in U$ if and only if $x \in (S \cup T) \cup U$.

(c) $S \cup S = S$ because $x \in S \cup S$ if and only if $x \in S$ or $x \in S$ if and only if $x \in S$.

(d) $S \cup \emptyset = S$ because there are no elements in $\emptyset$.

(e) $S \subseteq S \cup T$ because $x \in S$ if and only if $x \in S$ or $x \in T$.

(f) $T \subseteq S \cup T$ because $x \in T$ if and only if $x \in S$ or $x \in T$.

(g) $S \cup T = S$ if and only if $T \subseteq S$ because $S \cup T = S$ if and only if $T \subseteq S$ and $S \subseteq T$ if and only if $T \subseteq S$.

(h) $S \cup T = T$ if and only if $S \subseteq T$ because $S \cup T = T$ if and only if $S \subseteq T$ and $T \subseteq S$ if and only if $S \subseteq T$.

Lycopene is a red carotenoid of great importance because it is responsible for the pigment of tomatoes and other red fruits and vegetables and because it has been associated with many health benefits. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Here we report that the transcription factor RIPENING INHIBITOR (RIN) binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Lycopene is a red carotenoid that is responsible for the pigment of tomatoes and other red fruits and vegetables. Lycopene is a precursor of provitamin A and has been associated with many health benefits, such as a reduced risk of cardiovascular disease and certain cancers[1–3]. Although the lycopene biosynthetic pathway has been established, the regulation of lycopene accumulation in plants is poorly understood. Tomato fruits are a major source of lycopene, and lycopene accumulation in tomato fruits is a complex process that is affected by many factors, such as ripening, ethylene, light, temperature, and genotype[4–7]. Ripening-inhibitor (rin) is a recessive mutant that has been used extensively in studies of tomato fruit ripening. The rin mutant fruits do not ripen and do not accumulate lycopene, even in the presence of ethylene[8]. The RIN gene encodes a MADS-box transcription factor that is a master regulator of fruit ripening in tomato[9–12]. Although the RIN protein has been shown to bind to the promoters of several genes that are involved in ethylene biosynthesis and signal transduction, the genes that are directly regulated by RIN and the mechanism by which RIN regulates lycopene accumulation are unknown. Here we show that RIN binds to promoters of genes encoding lycopene biosynthesis enzymes in tomato fruits, activates their expression, and promotes lycopene accumulation. Ethylene and light inhibit the binding of RIN to the promoters of these genes, and ethylene also inhibits the expression of RIN. Our results suggest that RIN is a master regulator of lycopene biosynthesis in tomato fruits, and that ethylene and light inhibit lycopene accumulation in tomato fruits by inhibiting the expression of RIN and the binding of RIN to the promoters of genes encoding lycopene biosynthesis enzymes.

Lecture Mathematical Logic and Logic

Prof. Dr. Dr. h.c. Dr. h.c. Dr. h.c

Ch. 1 Lec 1 Part 1 - Sample Spaces and Events

Sample Space

Sample Space (**S**) is the set of all possible outcomes of an experiment. Perhaps, another example would be more useful. Let's say that we are interested in the outcome of a coin flip. Then the sample space is the set of all possible outcomes of a coin flip. Since there are only two possible outcomes, heads and tails, the sample space is the set of all possible outcomes of a coin flip, which is heads and tails.

$$S = \{H, T\}$$

Event

Event (**E**) is a subset of the sample space. For example, the event of getting heads is a subset of the sample space, which is heads and tails.

$$E = \{H\}$$

Mutually Exclusive

Mutually Exclusive events are events that cannot happen at the same time. For example, the event of getting heads and the event of getting tails are mutually exclusive because they cannot happen at the same time.

$$E_1 = \{H\}$$

$$E_2 = \{T\}$$

Exhaustive

Exhaustive events are events that include all possible outcomes. For example, the event of getting heads and the event of getting tails are exhaustive because they include all possible outcomes.

$$E_1 = \{H\}$$

$$E_2 = \{T\}$$

Lec 1 Part 2 Probability Axioms

Lec 1 Part 2 - Sample Spaces and Events

Axiom 1

Axiom 1 (**Axiom of Probability**) - Probability of an event **E** is a number **P(E)** such that **P(E)** is between **0** and **1**. Formally, **P(E)** is a function from the sample space **S** to the interval **[0, 1]**.

$$P(E) \in [0, 1]$$

Axiom 2 (**Axiom of Probability**) - Probability of the sample space **S** is **1**. Formally, **P(S)** is equal to **1**. In other words, the probability of the sample space is 1 because it is the probability of all possible outcomes.

$$P(S) = 1$$

Axiom 3 (**Axiom of Probability**) - If events **E1**, **E2**, **E3**, ... are mutually exclusive, then the probability of the union of these events is the sum of the probabilities of these events. In other words, the probability of the union of these events is the sum of the probabilities of these events.

$$P(E_1 \cup E_2 \cup E_3 \cup \ldots) = P(E_1) + P(E_2) + P(E_3) + \ldots$$

Lec 1 Part 3 - Conditional Probability

Lec 1 Part 3 - Sample Spaces and Events

Bayes' Theorem

Bayes' Theorem (**Bayes' Rule**) - Formula for calculating **P(A|B)** when **P(B|A)**, **P(A)** and **P(B)** are known. Formula: **P(A|B) = P(B|A) * P(A) / P(B)**

$$P(A|B) = \frac{P(B|A) \cdot P(A)}{P(B)}$$

Example

Example - Suppose that 1% of people have a certain disease. The test for the disease is 99% accurate. If a person tests positive, what is the probability that they have the disease? Let **A** be the event that a person has the disease and **B** be the event that a person tests positive. We are given **P(A) = 0.01**, **P(B|A) = 0.99**, and we need to find **P(A|B)**. We can use Bayes' Theorem to calculate **P(A|B)**.

$$P(A) = 0.01$$

$$P(B|A) = 0.99$$

$$P(A|B) = \frac{P(B|A) \cdot P(A)}{P(B)}$$

Lec 1 Part 4 - Independence

Lec 1 Part 4 - Sample Spaces and Events

Independence

Independence - Two events are independent if the occurrence of one does not affect the probability of the other. Formally, events **A** and **B** are independent if **P(A|B) = P(A)** and **P(B|A) = P(B)**. In other words, the probability of event **A** given that event **B** has occurred is the same as the probability of event **A** alone, and the probability of event **B** given that event **A** has occurred is the same as the probability of event **B** alone.

Example

Example - Suppose we have a fair coin and we flip it twice. The first flip is independent of the second flip. The probability of getting heads on the first flip is 1/2, and the probability of getting heads on the second flip is 1/2. The probability of getting heads on both flips is 1/4, which is the product of the probabilities of getting heads on each flip.

$$P(A) = 1/2$$

$$P(B) = 1/2$$

$$P(A \cap B) = 1/4$$

Conditional Independence

Conditional Independence - Two events are conditionally independent given a third event if the occurrence of one does not affect the probability of the other given the third event. Formally, events **A** and **B** are conditionally independent given **C** if **P(A|B, C) = P(A|C)** and **P(B|A, C) = P(B|C)**. In other words, the probability of event **A** given that event **B** has occurred and event **C** has occurred is the same as the probability of event **A** given that event **C** has occurred, and the probability of event **B** given that event **A** has occurred and event **C** has occurred is the same as the probability of event **B** given that event **C** has occurred.

Example

Example - Suppose we have a coin and we flip it twice. The first flip is independent of the second flip. The probability of getting heads on the first flip is 1/2, and the probability of getting heads on the second flip is 1/2. The probability of getting heads on both flips is 1/4, which is the product of the probabilities of getting heads on each flip. The probability of getting heads on both flips given that we have a fair coin is 1/4, which is the product of the probabilities of getting heads on each flip given that we have a fair coin.

$$P(A) = 1/2$$

$$P(B) = 1/2$$

$$P(A \cap B) = 1/4$$

$$P(A \cap B | \text{fair coin}) = 1/4$$

MATLAB/Simulink Model Based Design Workflow

Introduction

Model Based Design (MBD) is a formal methodology for developing complex control systems. It uses a single mathematical model as the central artifact from which requirements, simulation, code generation, and verification are derived. The model serves as the ground truth for all downstream activities, ensuring that changes propagate consistently across the entire development lifecycle.

Workflow Overview

The workflow consists of six stages: requirements capture, plant modeling, controller design, simulation and verification, code generation, and deployment. Each stage produces artifacts that feed into the next stage. Traceability links connect requirements to model elements to generated code to test results, so that any change can be assessed for its impact on every downstream artifact.

Plant Modeling

Plant modeling begins with the physical equations governing the system. For a DC motor, the equations are:

$$v(t) = Ri(t) + L\frac{di(t)}{dt} + K_e\omega(t)$$

$$J\frac{d\omega(t)}{dt} = K_t i(t) - B\omega(t) - \tau_L(t)$$

Controller Design

The controller is designed in the discrete domain. For a PI controller with sampling period T_s:

$$u[k] = K_p e[k] + K_i T_s \sum_{j=0}^{k} e[j]$$

Simulink Implementation

Simulink provides a block diagram environment for implementing the plant model and controller. Signal flow is explicit and visual. Simulink supports fixed-step and variable-step solvers, with fixed-step solvers required for real-time code generation.

Code Generation

Simulink Coder (formerly Real-Time Workshop) generates C code from the model. The generated code is deterministic, with no dynamic memory allocation and no recursion. Code generation can be configured for different target processors and optimization levels.

Verification

Model-in-the-loop (MIL) simulation verifies the model against requirements before code generation. Software-in-the-loop (SIL) simulation runs the generated code on a host machine to verify that the code behaves identically to the model. Hardware-in-the-loop (HIL) simulation runs the code on the target hardware with real sensors and actuators.

Deployment

Deployment packages the generated code with the target hardware's boot code and runtime libraries. Over-the-air (OTA) updates allow deployed systems to receive new versions without physical access.

Conclusion

Model Based Design provides a single source of truth for requirements, simulation, and implementation. Changes propagate automatically through the workflow, reducing the risk of inconsistencies between specification and implementation.

Ethnographic Notes on Tea Ceremony Practice in Contemporary Kyoto

Dr. Hiroshi Tanaka
Kyoto Institute of Cultural Anthropology

This paper presents ethnographic observations from twenty-four tea ceremony practitioners in Kyoto, including three professional tea masters and twenty-one amateur practitioners. It considers how the ceremony functions as a space for silent conversation, aesthetic discipline, and the negotiation of hierarchy between teacher and student.

Received 14 March 2025; revised 22 September 2025; accepted 5 November 2025.

1. Entering the Tea Room

The tea room at Mr. Sakamoto's house measures four tatami mats. Guests arrive in groups of three or four, kneel at the low entrance called the nijiriguchi, and bow before crawling through. Once inside, they sit in silence while the host prepares tea in front of them. The ceremony lasts between one and four hours depending on the occasion. Nobody speaks for the first twenty minutes.

Figure 1. Plan of the tea room. The host kneels at the hearth (left) and faces the guests across the tatami. The tokonoma (right) holds a single scroll and one flower. The nijiriguchi is the only entrance.

2. Silence as Conversation

Silence in the tea room is not absence of speech. It is a specific kind of speech that uses bowls, whisks, and steam instead of words. Mr. Sakamoto's students learn to read the host's intention from the angle of the bowl, the pause before the whisk, and the way the host refills the kettle. Misreading these signals is the most common error among beginners.

3. Hierarchy Without Speech

Three professional tea masters participated in this study. Their students addressed them only by their ceremony names, never by family names. Outside the tea room, the students addressed their teachers as sensei. Inside the room, the same people sat in rotation and served tea to one another. The hierarchy did not disappear; it became quiet.

4. Conclusion

The tea ceremony functions as a space where the aesthetic rules of the practice are more important than social status. Whether this is a model worth copying in other settings is a question this paper does not answer.

Chapter 4 Matrix Algebra

4.1 Sum and Scalar Product of Matrices

Definition

Sum of two matrices Two matrices A and B are said to be conformable for addition if they are of the same order. If $A = [a_{ij}]_{m \times n}$ and $B = [b_{ij}]_{m \times n}$ then the sum of A and B is defined as $A + B = [a_{ij} + b_{ij}]_{m \times n}$.

Scalar product If $A = [a_{ij}]_{m \times n}$ and k is a scalar then $kA = [ka_{ij}]_{m \times n}$.

Example

Solution

$$A + B = \begin{bmatrix} 1+7 & 2+8 & 3+9 \\ 4+10 & 5+11 & 6+12 \end{bmatrix} = \begin{bmatrix} 8 & 10 & 12 \\ 14 & 16 & 18 \end{bmatrix}$$

$$kA = \begin{bmatrix} 2 \times 1 & 2 \times 2 & 2 \times 3 \\ 2 \times 4 & 2 \times 5 & 2 \times 6 \end{bmatrix} = \begin{bmatrix} 2 & 4 & 6 \\ 8 & 10 & 12 \end{bmatrix}$$

Abstract: Artificial Intelligence (AI) is rapidly transforming healthcare by enhancing diagnostic accuracy, optimizing treatment plans, and improving patient outcomes. However, the integration of AI in healthcare raises significant ethical concerns, including data privacy, algorithmic bias, accountability, and the potential displacement of human caregivers. This study explores the ethical implications of AI in healthcare, focusing on the balance between innovation and patient rights. The study examines the ethical challenges associated with AI in healthcare, including the impact on patient autonomy, the potential for discrimination, and the need for transparency and accountability. The study also discusses the regulatory frameworks and guidelines that can ensure the ethical deployment of AI in healthcare, ensuring that the benefits of AI are maximized while safeguarding patient rights and maintaining trust in healthcare systems. The study concludes with recommendations for policymakers, healthcare providers, and AI developers to address the ethical challenges and promote the responsible use of AI in healthcare.

Fabaceae (8) and Euphorbiaceae (7) families were the most represented families. Leaves (35%) and roots (30%) were the most used plant parts. Decoction (32%) and powder (28%) were the most used preparations. Oral (60%) and topical (40%) were the most used modes of administration. Abstract

Deep learning (DL) models have shown promising performance in medical imaging tasks, including the detection of diabetic retinopathy (DR) and other eye diseases. However, it remains unclear how these models generalize to real-world clinical settings. Here we assess the generalizability of DL models for DR detection from fundus photographs across ethnicity, imaging camera, and disease severity and type in a dataset of 236,234 images from 40,339 diabetic patients. We find that the performance of DL models for referable DR detection is comparable across Asian, Caucasian, and African ethnicities (AUC: 0.936–0.946), but varies across cameras (AUC: 0.906–0.947) and is lower in severe DR (AUC: 0.885) and proliferative DR (AUC: 0.901) compared to moderate DR (AUC: 0.943). These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Introduction

Diabetes mellitus (DM) is a chronic disease that affects 463 million people worldwide and is projected to rise to 700 million by 2045[1]. Diabetic retinopathy (DR) is a common complication of DM and a major cause of blindness and vision impairment worldwide[2]. Early detection of DR followed by timely treatment can prevent vision loss[3], and thus, DM patients are recommended to undergo yearly DR screening[4]. However, in many countries, the shortage of eye care specialists and the high prevalence of DM make such a task difficult to accomplish[5]. Deep learning (DL) models have shown promising performance in the detection of DR from fundus photographs, with several studies reporting high sensitivity and specificity in retrospective datasets[6–9]. However, it remains unclear how these models generalize to real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Here we assess the generalizability of a DL model for referable DR (RDR) detection across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the United Kingdom (UK) Biobank[14].

Results

Study population characteristics

The UK Biobank dataset consisted of 236,234 fundus photographs from 40,339 diabetic patients, of which 1,401 (3.5%) had RDR, 1,067 (2.6%) had moderate DR, 1,250 (3.1%) had severe DR, and 1,175 (2.9%) had proliferative DR (PDR). Mean (SD) age was 56.8 (8.1) years, 23,561 (58.4%) were male, 1,937 (4.8%) were Asian, 1,478 (3.7%) were African, and 36,924 (91.5%) were Caucasian. Mean (SD) HbA1c was 75.1 (19.7) mmol/mol (9.0 (1.8)%), 3,553 (8.8%) had insulin treatment, and mean (SD) duration of DM was 8.7 (8.1) years. Mean (SD) age was 55.4 (8.1) years for those with RDR, 55.8 (8.1) years for those with moderate DR, 56.4 (8.1) years for those with severe DR, and 56.1 (8.1) years for those with PDR. Mean (SD) HbA1c was 81.0 (21.3) mmol/mol (9.6 (1.9)%) for those with RDR, 77.4 (19.9) mmol/mol (9.3 (1.8)%) for those with moderate DR, 79.4 (20.1) mmol/mol (9.4 (1.8)%) for those with severe DR, and 79.9 (20.4) mmol/mol (9.5 (1.9)%) for those with PDR. Insulin treatment was 14.1% (RDR), 12.1% (moderate DR), 13.8% (severe DR), and 13.8% (PDR). Mean (SD) duration of DM was 10.7 (8.4) years for those with RDR, 10.1 (8.2) years for those with moderate DR, 10.8 (8.2) years for those with severe DR, and 10.8 (8.2) years for those with PDR. Other baseline characteristics by DR status are shown in Table 1.

Performance of DL models for referable DR detection

We trained a DL model to detect RDR using fundus photographs from patients of Caucasian ethnicity, imaging with a Topcon camera, and without severe DR or PDR. The model achieved an AUC of 0.943 (95% CI: 0.937–0.949) in a randomly sampled test set of 9,000 images from 9,000 patients. The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2). The model achieved a sensitivity of 0.885 (95% CI: 0.869–0.901) and specificity of 0.857 (95% CI: 0.853–0.861) at the operating point selected in the development dataset (Table 2).

Performance of DL models across ethnicities

The model achieved an AUC of 0.936 (95% CI: 0.914–0.957) in Asian patients, 0.946 (95% CI: 0.935–0.956) in African patients, and 0.943 (95% CI: 0.937–0.949) in Caucasian patients (Table 2). The model achieved a sensitivity of 0.879 (95% CI: 0.821–0.927) in Asian patients, 0.893 (95% CI: 0.865–0.918) in African patients, and 0.885 (95% CI: 0.869–0.901) in Caucasian patients (Table 2). Other performance metrics by DR severity and type are shown in Table 2.

Discussion

In this study, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

Prior studies have shown promising performance of DL models for DR detection from fundus photographs, with several reporting sensitivities and specificities of over 90% in retrospective datasets[6–9]. However, it remains unclear how these models would perform in real-world clinical settings, where they may be used for DR screening. Prior studies have suggested that DL models may not generalize across ethnicities, imaging cameras, and disease severities and types[10–13], but these studies have been limited by the use of a single DL model, a single camera, or a single ethnicity, and have not assessed the impact of disease severity and type on model performance. Our study addresses these gaps in the literature by assessing the performance of a DL model across ethnicities, cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank.

Our study shows that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation. The lower performance in severe DR and PDR suggests that DL models may miss some of the most severe cases of DR, which are the cases that require urgent referral to an eye care specialist[3]. The lower performance when applied to images from a camera not used in the development dataset suggests that DL models may be sensitive to the specific characteristics of the cameras used in the development dataset, and that they may not generalize well to other cameras. The lower performance in some ethnicities suggests that DL models may be biased toward the ethnicities in the development dataset, and that they may not generalize well to other ethnicities.

Our study has several strengths. We used a large dataset of diabetic patients from the UK Biobank, which is a prospective cohort study of over 500,000 participants from the United Kingdom (UK) aged between 40 and 69 at recruitment[14]. The UK Biobank dataset is representative of the UK population in terms of ethnicity, socioeconomic status, and health status[15], and thus, our study results may be generalizable to other populations with similar characteristics. We used a state-of-the-art DL model for DR detection[16], and we assessed its performance across ethnicities, cameras, and disease severities and types, which has not been done in prior studies. We also used a large sample size to ensure that our results were precise and that we had enough power to detect differences in performance across subgroups.

Our study has several limitations. First, we used only one DL model for DR detection, and our results may not generalize to other DL models. Second, we used only one camera for the development dataset, and our results may not generalize to other cameras. Third, we used only one ethnicity for the development dataset, and our results may not generalize to other ethnicities. Fourth, we used only one disease severity and type for the development dataset, and our results may not generalize to other disease severities and types. Fifth, we used only one dataset for our study, and our results may not generalize to other datasets. Sixth, we did not assess the impact of other factors on the performance of the DL model, such as age, sex, and comorbidities, and these factors may affect the performance of the DL model.

In conclusion, we assessed the generalizability of a DL model for referable DR detection across ethnicities, imaging cameras, and disease severities and types in a large dataset of diabetic patients from the UK Biobank. We found that the performance of the DL model was comparable across Asian, Caucasian, and African ethnicities, but was lower in severe DR and PDR than in those without severe DR or PDR. The model also performed worse when applied to images from a camera not used in the development dataset. These results suggest that DL models for DR screening may not generalize across all ethnicities, cameras, and disease severities and types, and that such models should be tested in these settings before implementation.

1.1 Introduction

Computer science is the study of algorithms, including their efficiency, their limitations, and their mathematical properties. Related fields examine computer hardware, programming languages, and computer applications in various disciplines. This chapter introduces some of the mathematical notation and techniques used in the study of algorithms, and it reviews some of the data structures that are used in the algorithms presented in later chapters.

1.2 Mathematical Notation and Functions

Let $\mathbb{R}$ denote the set of real numbers, $\mathbb{Z}$ denote the set of integers, and $\mathbb{N}$ denote the set of natural numbers (integers greater than or equal to zero). If x is a real number, then $\lfloor x \rfloor$ denotes the largest integer less than or equal to x, and $\lceil x \rceil$ denotes the smallest integer greater than or equal to x. For example, $\lfloor 3.14 \rfloor = 3$ and $\lceil 3.14 \rceil = 4$. Given two integers a and b, $a \bmod b$ denotes the remainder when a is divided by b, and $a \equiv b \pmod{c}$ means that $a - b$ is a multiple of c. For example, $7 \bmod 3 = 1$ and $7 \equiv 1 \pmod{3}$.

1.2.1 Logarithms and Exponents

Unless otherwise specified, all logarithms are base 2. For $x > 0$, $\log(x)$ denotes the base-2 logarithm of x. For $x > 0$ and $y > 0$, $\log(xy) = \log(x) + \log(y)$. For $x > 0$ and $y > 0$, $\log(x/y) = \log(x) - \log(y)$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$. For $x > 0$ and $y > 0$, $\log(x^y) = y \log(x)$. For $x > 0$ and $y > 0$, $x^{\log(y)} = y^{\log(x)}$.

1.2.2 Factorial and Binomial Coefficients

For $n \in \mathbb{N}$, $n!$ denotes the factorial of n, defined as $n! = n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1$. For $n \in \mathbb{N}$, $n! = n \cdot (n-1)!$. For $n \in \mathbb{N}$, $n! = \prod_{i=1}^{n} i

Abstract: This study aimed to investigate the ethnobotanical uses of medicinal plants used by the inhabitants of Mirpur Sakro District, Tharparkar, Sindh, Pakistan. Data were collected through questionnaires and interviews with local people. A total of 10 medicinal plants belonging to 10 families were recorded. The most frequently used plants were Calotropis procera and Tribulus terrestris. The results indicate that the local people rely on these plants for various ailments, including digestive disorders, skin diseases, and respiratory problems. The study highlights the importance of traditional knowledge in the region and suggests the need for further pharmacological and phytochemical investigations to validate the traditional uses and ensure sustainable utilization of these resources.

7.2 Cluster Representations

7.2.1 Centroids and Prototypes (Medoids)

Definition. Let $C_k = \{x_1, x_2, \ldots, x_{n_k}\}$ be a cluster with n_k points. The **centroid** (or **mean**) of C_k is the point

$$\mu_k = \frac{1}{n_k} \sum_{i=1}^{n_k} x_i$$

Example 7.2.1. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1)\}$. Then

$$\mu_1 = \frac{1}{3}\left((1,2) + (2,3) + (3,1)\right) = \frac{1}{3}(6,6) = (2,2)$$

Proposition 7.2.1. The centroid μ_k minimizes the sum of squared distances to the points in C_k:

$$\mu_k = \arg\min_{\mu \in \mathbb{R}^d} \sum_{i=1}^{n_k} \|x_i - \mu\|^2$$

Proof. Expand the objective:

$$\sum_{i=1}^{n_k} \|x_i - \mu\|^2 = \sum_{i=1}^{n_k} \|x_i\|^2 - 2\mu^T \sum_{i=1}^{n_k} x_i + n_k \|\mu\|^2$$

This is a quadratic in μ. Setting the gradient to zero:

$$\nabla_\mu \left[\sum_{i=1}^{n_k} \|x_i - \mu\|^2\right] = -2\sum_{i=1}^{n_k} x_i + 2n_k\mu = 0$$

$$\Rightarrow \mu = \frac{1}{n_k}\sum_{i=1}^{n_k} x_i$$

Remark. The centroid is not necessarily a data point. For example, the centroid of $\{(0,0), (1,0)\}$ is $(0.5, 0)$, which is not a data point.

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

$$m_k = \arg\min_{x \in C_k} \sum_{i=1}^{n_k} \|x_i - x\|$$

Remark. Unlike the centroid, the medoid must be a data point. This makes it more robust to outliers and applicable to non-Euclidean distances (e.g., edit distance for strings, Jaccard distance for sets).

Example 7.2.2. Consider the cluster $C_1 = \{(1,2), (2,3), (3,1), (100,100)\}$. The centroid is $\mu_1 = (26.5, 26.5)$, which is far from most points. The medoid is $m_1 = (2,3)$, which is much closer to the majority of points.

Definition. The **medoid** of C_k is the point $m_k \in C_k$ that minimizes the sum of distances to all other points in C_k:

Lesson Twenty-one | Matrix Multiplication and Inverses

Matrix multiplication is the heart of linear algebra. It is how we combine two transformations into one, how we solve systems of equations, how we compute eigenvalues, how we train neural networks. Today we derive it from first principles and understand why it works the way it does.

1. Motivation: Why Do We Need Matrix Multiplication?

Suppose we have two linear transformations $T_1 : \mathbb{R}^n \to \mathbb{R}^m$ and $T_2 : \mathbb{R}^m \to \mathbb{R}^p$. Their composite $T_2 \circ T_1 : \mathbb{R}^n \to \mathbb{R}^p$ is also linear. If A represents T_1 and B represents T_2, we want a matrix C such that

$$(T_2 \circ T_1)(\mathbf{x}) = C\mathbf{x} \quad \text{for all } \mathbf{x} \in \mathbb{R}^n.$$

We want C to be the product BA.

2. Definition

Definition 2.1 (Matrix Multiplication). Let $A \in \mathbb{R}^{m \times n}$ and $B \in \mathbb{R}^{n \times p}$. The product $C = AB \in \mathbb{R}^{m \times p}$ is defined by

$$c_{ij} = \sum_{k=1}^{n} a_{ik} b_{kj}, \qquad 1 \le i \le m, \; 1 \le j \le p.$$

---

3. Properties

Theorem 3.1 (Properties of Matrix Multiplication). Assuming the sizes match, the following hold:

1. **Associativity:** $(AB)C = A(BC)$.
2. **Distributivity:** $A(B + C) = AB + AC$ and $(A + B)C = AC + BC$.
3. $(AB)^T = B^T A^T$.
4. $\det(AB) = \det(A)\det(B)$.
5. $\operatorname{tr}(AB) = \operatorname{tr}(BA)$.

Proof. (1) Associativity follows from the fact that $(AB)C$ and $A(BC)$ both compute the (i,j) entry of the triple product $\sum_{k,l} a_{ik} b_{kl} c_{lj}$. (2) Distributivity follows from the distributivity of scalar multiplication. (3) $(AB)^T_{ij} = (AB)_{ji} = \sum_k a_{jk} b_{ki} = \sum_k b_{ki} a_{jk} = (B^T A^T)_{ij}$. (4) Taken for granted for now; we will prove it in Lesson Twenty-two. (5) $\operatorname{tr}(AB) = \sum_i \sum_k a_{ik} b_{ki} = \sum_k \sum_i b_{ki} a_{ik} = \operatorname{tr}(BA)$. □

Warning. Matrix multiplication is not commutative. In general $AB \neq BA$. Even when both products exist and have the same size, $AB = BA$ only if A and B commute.

---

4. Inverses

Definition 4.1 (Inverse). A square matrix $A \in \mathbb{R}^{n \times n}$ is invertible if there exists A^{-1} such that

$$AA^{-1} = A^{-1}A = I_n.$$

Theorem 4.2 (Uniqueness). If A is invertible, A^{-1} is unique.

Proof. If B and C both satisfy $AB = BA = I$ and $AC = CA = I$, then $B = BI = B(AC) = (BA)C = IC = C$. □

Theorem 4.3 (Properties of Inverses).

1. $(AB)^{-1} = B^{-1}A^{-1}$.
2. $(A^T)^{-1} = (A^{-1})^T$.
3. $\det(A^{-1}) = 1/\det(A)$.

---

5. Exercises

Exercise 5.1. Compute $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}\begin{bmatrix} 5 & 6 \\ 7 & 8 \end{bmatrix}$ by hand.

Exercise 5.2. Show that $(AB)^{-1} = B^{-1}A^{-1}$ when A and B are invertible.

Exercise 5.3. Prove that $\operatorname{tr}(AB) = \operatorname{tr}(BA)$ without using the formula $c_{ij} = \sum_k a_{ik} b_{kj}$.

---

6. Closing Remarks

Matrix multiplication is the engine of linear algebra. Every theorem we will prove in the next few lessons depends on it. Lesson Twenty-two: determinants. Lesson Twenty-three: eigenvalues. Lesson Twenty-four: the spectral theorem. Lesson Twenty-five: applications to machine learning.

第一章 Flutter 基础概念和设计

1.1 Widget 是一切 UI 的基本单位

Flutter 的核心哲学是一切皆 Widget。

```
Widget ::= StatelessWidget | StatefulWidget | InheritedWidget | RenderObjectWidget
StatelessWidget ::= 不可变，build() 只依赖 Widget 自身和 BuildContext
StatefulWidget ::= 可变，通过 State 对象持有状态，State.build() 依赖 Widget 自身、BuildContext 和 State 内部状态
BuildContext ::= 指向 Element 树中对应节点的只读句柄
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.2 三棵树的关系

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{inflate}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject\ Tree}$$

$$\mathrm{Widget\ Tree} \xrightarrow{\mathrm{diff}} \mathrm{Element\ Tree} \xrightarrow{\mathrm{layout,\ paint}} \mathrm{Screen}$$

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.3 Widget 不可变性

Widget 一旦创建，其属性全部 `final`。`build()` 每次调用返回全新 Widget 实例，旧实例丢弃。Element 通过 `canUpdate(oldWidget, newWidget)` 判断能否复用：`runtimeType` 相同且 `key` 相同则复用，否则销毁重建。

1.4 Element 生命周期

```
Element ::= 挂载 (mount) → 活跃 (active) → 卸载 (unmount)
mount ::= 调用 Widget.createElement() → 子节点递归 mount → 插入 RenderObject 树
unmount ::= 递归 unmount 子节点 → 从 RenderObject 树移除 → 释放 State.dispose()
```

1.5 RenderObject 层

```
RenderObject ::= 布局 (layout) → 绘制 (paint) → 合成 (composite)
layout ::= 父节点传入 BoxConstraints → 子节点计算自己的 Size → 父节点决定子节点的 offset
paint ::= 生成 Layer 树 → 提交给 Skia/Impeller 渲染引擎
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.6 Key 的作用

```
Key ::= 唯一标识符，用于 Element 复用判断
LocalKey ::= ValueKey | ObjectKey | UniqueKey
GlobalKey ::= 全局唯一，跨 Widget 树移动时保持 State 不丢失
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

1.7 BuildContext 的本质

```
BuildContext ::= 指向 Element 树中对应节点的只读句柄
context.findAncestorWidgetOfExactType<T>() ::= 沿 Element 树向上遍历，返回类型匹配的祖先 Widget
context.findRenderObject() ::= 返回 Element 对应的 RenderObject
```

$$\mathrm{Widget} \xrightarrow{\mathrm{inflate}} \mathrm{Element} \xrightarrow{\mathrm{mount}} \mathrm{RenderObject}$$

MR. TIGER MAGNIFICENT

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

In what distant deeps or skies

Burnt the fire of thine eyes?

On what wings dare he aspire?

What the hand dare seize the fire?

And what shoulder, and what art,

Could twist the sinews of thy heart?

And when thy heart began to beat,

What dread hand? And what dread feet?

What the hammer? What the chain,

In what furnace was thy brain?

What the anvil? What dare

Grasp thy deadly terrors clare?

When the stars threw down their spears

And water'd heaven with their tears,

Did he smile his work to see?

Did he who made the lamb make thee?

Tiger Tiger, burning bright

In the forests of the night,

What immortal hand or eye

Could frame thy fearful symmetry?

Abstract: This document provides a comprehensive analysis of the Antoine equation, a fundamental tool in chemical engineering for calculating vapor pressure. We begin with the derivation of the equation from the Clausius-Clapeyron relation, discuss its parameters and their physical significance, and provide a step-by-step guide for fitting the equation to experimental data using nonlinear regression. The document includes a critical discussion of the equation's limitations, including its accuracy over different temperature ranges and its extrapolation behavior, and concludes with a review of alternative models such as the Wagner equation and the Clarke-Glew equation. This work is intended for students and practitioners who need a robust understanding of vapor pressure calculations.

1.1 Introduction

Consider the system of equations $x + y = 2$, $x - y = 0$. Adding the two equations gives the new equation $2x = 2$, which has solution $x = 1$.

Substituting back into the first equation gives $y = 1$.

Thus, $(x, y) = (1, 1)$ is the unique solution to the system.

Abstract

We prove that every finite group of order n is isomorphic to a subgroup of the symmetric group S_n. This classical result, due to Cayley, is well known but is often presented in a form that obscures its simplicity. We give a short, self-contained proof using only the definition of a group and the notion of a permutation. We also discuss the right-regular representation and its relation to the left-regular representation, and we give a small worked example for $n = 4$.

1. Introduction

Let G be a finite group of order n. We write e for the identity element and gh for the product $g \cdot h$. The symmetric group on n letters, denoted S_n, is the group of all bijections from a set of n elements to itself, with composition as the group operation.

Cayley's theorem asserts that every finite group is isomorphic to a subgroup of S_n. The proof is usually presented in a form that obscures its simplicity. This note gives a short, self-contained proof and discusses the right-regular representation and its relation to the left-regular representation.

2. Preliminaries

Let G be a finite group of order n. We write e for the identity element and gh for the product $g \cdot h$.

Definition 2.1. A permutation of a set X is a bijection $\sigma : X \to X$. The symmetric group on X, denoted S_X, is the group of all permutations of X under composition. When $X = \{1, 2, \ldots, n\}$, we write S_n for S_X.

Lemma 2.2. Let G be a finite group of order n. Then $|S_n| = n!$.

Proof. Trivial. $\square$

3. Cayley's theorem

Theorem 3.1. Every finite group of order n is isomorphic to a subgroup of S_n.

Proof. Let $G = \{g_1, g_2, \ldots, g_n\}$ with $g_1 = e$. For $g \in G$ define $\sigma_g : G \to G$ by

$$\sigma_g(g_i) = g g_i \qquad (1 \le i \le n).$$

Step 1. σ_g is a bijection. If $\sigma_g(g_i) = \sigma_g(g_j)$, then $g g_i = g g_j$, so $g_i = g_j$ by left cancellation. Hence σ_g is injective. Since G is finite, injectivity implies surjectivity, so $\sigma_g \in S_n$.

Step 2. $\sigma : G \to S_n$ is a homomorphism. For $g, h \in G$ and $g_i \in G$,

$$\sigma_{gh}(g_i) = (gh) g_i = g(h g_i) = \sigma_g(\sigma_h(g_i)),$$

so $\sigma_{gh} = \sigma_g \circ \sigma_h$.

Step 3. σ is injective. If $\sigma_g = \sigma_e$, then $g g_i = g_i$ for all i, in particular $g g_1 = g_1$, so $g = e$.

Hence $G \cong \sigma(G) \leq S_n$. $\square$

Remark 3.2. The proof uses the right-regular representation $g \mapsto \sigma_g$. The corresponding left-regular representation $g \mapsto \tau_g$ with $\tau_g(g_i) = g_i g$ is also a homomorphism but not an isomorphism in general.

4. Example

For $n = 4$ and $G = V_4 = \{e, a, b, c\}$ with $a^2 = b^2 = c^2 = e$ and $ab = c$, we have, for example, $\sigma_a(b) = c$ and $\sigma_a(c) = b$.

5. Conclusion

We have shown that every finite group of order n is isomorphic to a subgroup of S_n. The corresponding fact for infinite groups is false: $\mathbb{Z}$ is a counter-example, since S_n is finite for every n but $\mathbb{Z}$ has no finite image.

THIS CHECK IS ISSUED PURSUANT TO A CONSTITUTIONAL MANDATE.

THE STATE OF CALIFORNIA IS PLEDGED TO PAY THIS CHECK.

THIS CHECK CONSTITUTES A PRIORITY PAYMENT UNDER ARTICLE XVI, SECTION 18 OF THE CALIFORNIA CONSTITUTION. THE STATE'S PAYMENT OBLIGATION UNDER THIS CHECK IS SECURED BY THE PROCEEDS OF A LEGALLY AUTHORIZED INTERNAL BORROWING.

1.1 Cartesian coordinates in the plane

Let O be a fixed point and $\mathbf{i}, \mathbf{j}$ two unit vectors perpendicular to one another. Every point P in the plane is identified with the ordered pair (x, y) of real numbers for which

$$\overrightarrow{OP} = x\,\mathbf{i} + y\,\mathbf{j}.$$

The number x is the abscissa and y the ordinate of P. Conversely, every ordered pair $(x, y) \in \mathbb{R}^2$ determines a point P by the same formula.

Let $P_1 = (x_1, y_1)$ and $P_2 = (x_2, y_2)$. The distance between them is

$$d(P_1, P_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}. \tag{1.1.1}$$

Equation (1.1.1) is the Euclidean metric on $\mathbb{R}^2$. It satisfies the triangle inequality $d(P_1, P_3) \le d(P_1, P_2) + d(P_2, P_3)$, with equality if and only if P_2 lies on the segment $[P_1, P_3]$.

1.2 Lines and their equations

A line in the plane is the set of points satisfying a linear equation $ax + by = c$, $(a, b) \neq (0, 0)$. Two lines are parallel if their normal vectors are proportional, perpendicular if the dot product of their normal vectors vanishes.

1.3 Circles

A circle of radius $r > 0$ centred at (h, k) is the locus $(x - h)^2 + (y - k)^2 = r^2$. Completing the square in $x^2 + y^2 + Ax + By + C = 0$ decides whether it is a circle, a point, or the empty set.

1.4 Conic sections

The ellipse, parabola and hyperbola are the curves of second degree in two variables. Their canonical forms are $x^2/a^2 + y^2/b^2 = 1$, $y^2 = 4px$, and $x^2/a^2 - y^2/b^2 = 1$. Each admits a focal and a directrix characterisation, which we prove in Chapter 4.

§ 141.62 — Maximum contaminant levels (MCLs) for inorganic chemicals

Subpart G — National Primary Drinking Water Regulations

Part 141 — National Primary Drinking Water Regulations

Subchapter D — Public Water Systems

Chapter I — Environmental Protection Agency

Title 40 — Protection of Environment

(a) Maximum contaminant levels (MCLs) for inorganic chemicals. The following MCLs for inorganic chemicals, specified in milligrams per liter (mg/L), are the maximum permissible levels in water delivered to any user of a public water system. Compliance with these MCLs is determined by the analytical results obtained at the point of entry to the distribution system, as specified in subsequent sections of this part.

(1) Antimony — 0.006 mg/L.

(2) Arsenic — 0.010 mg/L. Effective date: January 23, 2006. Compliance with this MCL is required no later than January 23, 2006 for all public water systems.

(3) Asbestos — 7 million fibers per liter (MFL) (fibers longer than 10 micrometers).

(4) Barium — 2.0 mg/L.

(5) Beryllium — 0.004 mg/L.

(6) Cadmium — 0.005 mg/L.

(7) Chromium (total) — 0.100 mg/L.

(8) Cyanide (as free cyanide) — 0.200 mg/L.

(9) Fluoride — 4.0 mg/L. Secondary maximum contaminant level (SMCL): 2.0 mg/L.

(10) Mercury (inorganic) — 0.002 mg/L.

(11) Nitrate (as nitrogen) — 10.0 mg/L.

(12) Nitrite (as nitrogen) — 1.0 mg/L.

(13) Total nitrate and nitrite (as nitrogen) — 10.0 mg/L.

(14) Selenium — 0.050 mg/L.

(15) Thallium — 0.002 mg/L.

(b) Compliance. Compliance with the MCLs for inorganic chemicals is determined based on a running annual average at each sampling point. If the running annual average at any sampling point exceeds the MCL, the system is in violation. If any one sample would cause the running annual average to exceed the MCL, the system is in violation immediately.

(c) Reporting. Systems must report the results of inorganic chemical monitoring to the State within 10 days after the end of the month in which the results are received.

Abstract

Is the Chinese Communist Party (CCP) an ideology or interest-led? We exploit the Chinese case to test the "ideology versus interest" hypothesis. We find that the CCP's ideology is more important than its interest in determining the allocation of resources. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the non-state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector. We also find that the CCP's ideology is more important than its interest in determining the allocation of resources in the state sector.

Abstract: This study examines the impact of Ayushman Bharat on healthcare access and financial protection among rural households in Uttarakhand, India. Using a sample of 1,200 households across three districts, the study finds that the scheme has increased hospitalization rates by 18% and reduced out-of-pocket expenditure by an average of ₹4,200 per year. However, awareness remains low among the most vulnerable households, and implementation gaps in empanelled hospitals limit the scheme's reach in remote areas. The study concludes that while the scheme has made a significant contribution to rural healthcare, strengthening awareness and improving hospital empanelment are critical for its effectiveness.

Q1. Find $\int \frac{\sqrt{\tan x}}{\sin x \cos x}\,dx$

A1. Substitute $t = \sqrt{\tan x}$ to obtain $\int \frac{2t}{t^2 - 1}\,dt$.

Q2. Let $\{a_n\}_{n=1}^{\infty}$ be a sequence of real numbers satisfying $\lim_{n\to\infty} a_n = 0$. Prove that $\lim_{n\to\infty} \frac{a_1 + a_2 + \cdots + a_n}{n} = 0$.

A2. Let $\varepsilon > 0$ be arbitrary. Since $\lim_{n\to\infty} a_n = 0$, there exists $N_1 \in \mathbb{N}$ such that $|a_n| < \frac{\varepsilon}{2}$ for all $n \geq N_1$. Let $M = |a_1| + |a_2| + \cdots + |a_{N_1 - 1}|$. Choose $N_2 \in \mathbb{N}$ such that $N_2 > \frac{2M}{\varepsilon}$. Let $N = \max\{N_1, N_2\}$. Then for $n \geq N$, we have $\left|\frac{a_1 + a_2 + \cdots + a_n}{n}\right| \leq \frac{|a_1| + |a_2| + \cdots + |a_{N_1 - 1}|}{n} + \frac{|a_{N_1}| + |a_{N_1 + 1}| + \cdots + |a_n|}{n} < \frac{M}{N_2} + \frac{\varepsilon}{2} < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$.

Q3. Find $\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx$

A3.

$$\int_0^1 \frac{\log(1+x)}{1+x^2}\,dx = \frac{\pi}{8}\log 2 + \int_0^1 \frac{\arctan x}{1+x}\,dx$$

Q4.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Q5. Let $f(x) = \sqrt{x}$ on $[0, 1]$. Show that f is uniformly continuous on $[0, 1]$ but not Lipschitz on $[0, 1]$.

A5. Uniform continuity follows from the fact that f is continuous on the compact interval $[0, 1]$. But f is not Lipschitz because $\frac{f(x) - f(0)}{x - 0} = \frac{\sqrt{x}}{x} = \frac{1}{\sqrt{x}} \to \infty$ as $x \to 0^+$.

Q6.

```
#include <iostream>
int main() { int n, sum = 0; while (cin >> n) { sum += n; } cout << sum << endl; }
```

Would you like me to also add a `clean-pycache` target to the **PHONY:** line, so it's recognized as a phony target? It's not strictly required, but it's a good practice.

Introduction to Cosmology

Cosmology and Astronomy

Cosmology and Astronomy

Cosmology is the study of the universe as a whole.

Astronomy is the study of the objects and phenomena within the universe.

Cosmology and astronomy are closely related, but they differ in their focus and scale. Astronomy is the study of individual celestial objects and phenomena, such as stars, planets, galaxies, and black holes. It aims to understand the properties, behaviors, and interactions of these objects and phenomena within the universe. On the other hand, cosmology is the study of the universe as a whole, including its overall structure, evolution, and the fundamental laws that govern its behavior. Cosmology seeks to understand the universe's origin, composition, and the forces that shape its large-scale structure and dynamics.

While astronomy focuses on the study of individual celestial objects and phenomena, cosmology takes a broader perspective and aims to understand the universe as a whole, including its overall structure, evolution, and the fundamental laws that govern its behavior. Cosmology seeks to understand the universe's origin, composition, and the forces that shape its large-scale structure and dynamics.

Mixed-prec OPT-125M finetuning weird

Hi,

I have a weird issue. I'm finetuning OPT-125M using

```
python -m torch.distributed.run --nproc_per_node=8 --master_port=29500 train.py --model_name_or_path facebook/opt-125m --data_path ./alpaca_data.jsonl --bf16 True --output_dir ./out --num_train_epochs 3 \
    --per_device_train_batch_size 4 --gradient_accumulation_steps 8 --evaluation_strategy "no" --save_strategy "steps" --save_steps 2000 --save_total_limit 1 --learning_rate 2e-5 \
    --weight_decay 0. --warmup_ratio 0.03 --lr_scheduler_type "cosine" --logging_steps 1 --fsdp "full_shard auto_wrap" --fsdp_transformer_layer_cls_to_wrap "OPTDecoderLayer" --tf32 True
```

on 8 A100s. It runs fine for first epoch. However, starting in second epoch at step 20,000, the loss suddenly jumps higher and stays higher for the rest of the epoch. Normally, training loss decreases throughout epoch.

Journal de bord du projet Lumi-Cube

Jour 1 : Mise en place et choix du matériel

Aujourd'hui, je commence officiellement le projet Lumi-Cube. L'idée est de créer un cube lumineux connecté qui réagit aux mouvements et aux couleurs environnantes. Mon objectif principal est de maîtriser l'intégration de capteurs variés avec un système embarqué pour créer une interface utilisateur intuitive et ludique.

Pour ce premier jour, j'ai passé la majorité du temps à rechercher les composants nécessaires. Le cerveau du cube sera un ESP32-S3 DevKitC-1 N16R8 V1.1 pour sa puissance et ses connexions Wi-Fi/Bluetooth. Pour la lumière, j'ai opté pour une bande de 60 LED WS2812B (NeoPixel) qui offre une bonne densité lumineuse. Enfin, pour la détection de mouvement, je me suis tourné vers un capteur MPU-6050 qui combine accéléromètre et gyroscope.

Voici mon premier croquis du boîtier :

Jour 2 : Assemblage et premiers tests

Aujourd'hui, j'ai commencé l'assemblage du prototype. Le plus gros défi a été de souder les fils sur la bande LED et de les connecter au capteur MPU-6050 sans trop de bruit parasite. Après quelques heures de bricolage, j'ai réussi à faire clignoter la bande LED et à lire les données du capteur. Le code initial pour le capteur est basé sur la bibliothèque officielle d'Adafruit.

Jour 3 : Intégration et premier prototype fonctionnel

Aujourd'hui, j'ai intégré tous les composants dans le boîtier. Le code final pour le capteur est maintenant stable et je commence à mapper les données d'inclinaison pour contrôler la couleur de la lumière. Le prototype est maintenant fonctionnel et je peux commencer à tester différentes couleurs et intensités.

Jour 4 : Optimisation et ajout de fonctionnalités

Aujourd'hui, j'ai commencé à optimiser le code et à ajouter des fonctionnalités. Je suis actuellement en train de tester différentes couleurs et intensités pour trouver le meilleur rendu.

Jour 5 : Finalisation et documentation

Aujourd'hui, j'ai finalisé le projet et commencé à rédiger la documentation. Je suis satisfait du résultat final et je pense que le prototype est prêt à être présenté.

1.1 Introduction to Signals and Systems

1.1.1 Signals

Signals are the information-bearing functions. Signals can be of one dimension (like speech), two dimensions (such as pictures), three dimensions (like moving pictures), or more. We will mostly deal with one-dimensional signals in this course.

1.1.2 Systems

Systems are mathematical operators or functions that transform one signal into another. Consider, for example, the system T that maps $x(t)$ to $y(t)$ by multiplying the input by a factor of two, delaying it by one second, and then adding a constant of 3:

$$y(t) = T[x(t)] = 2x(t-1) + 3$$

Systems can also be combined, operated on, or even created by feedback. Consider, for example, the system T that maps $x(t)$ to $y(t)$ by multiplying the input by a factor of two, delaying it by one second, and then adding a constant of 3:

$$y(t) = T[x(t)] = 2x(t-1) + 3$$

$$y(t) = T[x(t)] = 2x(t-1) + 3$$

1.1.3 Signal Properties

1.1.3.1 Periodicity

Periodicity is a property of signals that means that the signal repeats itself after a certain period of time. For example, the sine function is periodic with a period of 2π because $\sin(x) = \sin(x + 2\pi)$. Mathematically, a signal $x(t)$ is periodic if there exists a positive constant T such that:

$$x(t) = x(t+T)$$

$$x(t) = x(t+T)$$

1.1.3.2 Symmetry

Symmetry refers to the property of a signal that it remains unchanged when it is reflected or rotated. For example, a signal $x(t)$ is even if $x(t) = x(-t)$, and it is odd if $x(t) = -x(-t)$. Symmetry can be useful in simplifying the analysis of signals and systems.

1.1.3.3 Energy and Power

Energy and power are two important concepts in signal processing. The energy of a signal is the total amount of energy it contains, while the power is the average energy per unit time. The energy of a signal $x(t)$ is defined as:

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt$$

$$E = \int_{-\infty}^{\infty} |x(t)|^2 dt$$

The power of a signal is defined as the average energy per unit time:

$$P = \lim_{T \to \infty} \frac{1}{2T} \int_{-T}^{T} |x(t)|^2 dt$$

$$P = \lim_{T \to \infty} \frac{1}{2T} \int_{-T}^{T} |x(t)|^2 dt$$

1.1.3.4 Orthogonality

Orthogonality is a property of signals that means that they are independent of each other. For example, two signals $x(t)$ and $y(t)$ are orthogonal if their inner product is zero:

$$\langle x(t), y(t) \rangle = \int_{-\infty}^{\infty} x(t)y^*(t) dt = 0$$

$$\langle x(t), y(t) \rangle = \int_{-\infty}^{\infty} x(t)y^*(t) dt = 0$$

1.1.4 Conclusion

In this section, we have introduced the concepts of signals and systems, and we have discussed some of the properties of signals, such as periodicity, symmetry, energy and power, and orthogonality. These concepts are fundamental to the study of signals and systems, and they will be useful in the subsequent chapters of this course.

Abstract: Ultrafast electrochemical intercalation underlies high-power electrochemical energy storage devices, such as supercapacitors. This intercalation is accompanied by phase transitions and strong electrostatic forces and is thought to be kinetically limited by ion diffusion. However, the intercalation kinetics and the underlying mechanisms are not well understood. Here, we develop a multiscale theory to study ultrafast electrochemical intercalation. We show that intercalation is not limited by diffusion but by the nucleation of new phases. We also show that the intercalation kinetics are governed by the electrostatic interactions between the intercalated ions and the host lattice. We further show that the electrostatic interactions can induce a phase transition from a disordered solid solution to a phase with ordered ion-vacancy layers, which further slows down the intercalation kinetics. We propose that the ordered ion-vacancy layers can be suppressed by tuning the electrostatic interactions, which we show can lead to ultrafast intercalation. Our theory provides a fundamental understanding of ultrafast electrochemical intercalation and suggests new strategies for the design of high-power electrodes.

1 Introduction

Ultrafast electrochemical intercalation is the key to high-power electrochemical energy storage devices, such as supercapacitors. This intercalation is accompanied by phase transitions and strong electrostatic forces and is thought to be kinetically limited by ion diffusion. However, the intercalation kinetics and the underlying mechanisms are not well understood. Here, we develop a multiscale theory to study ultrafast electrochemical intercalation. We show that intercalation is not limited by diffusion but by the nucleation of new phases. We also show that the intercalation kinetics are governed by the electrostatic interactions between the intercalated ions and the host lattice. We further show that the electrostatic interactions can induce a phase transition from a disordered solid solution to a phase with ordered ion-vacancy layers, which further slows down the intercalation kinetics. We propose that the ordered ion-vacancy layers can be suppressed by tuning the electrostatic interactions, which we show can lead to ultrafast intercalation. Our theory provides a fundamental understanding of ultrafast electrochemical intercalation and suggests new strategies for the design of high-power electrodes.

Mrs. Tiggy-winkle and her family washed and ironed,

and hung out clothes all the morning; and at

noon they sat down to a delicious dinner of roast chicken and green peas and new potatoes, and

custard pudding and strawberry tart. Afterwards they washed up the china and put it away in the

Is the only character who can make Figgy blush.

Keeps a tin under the floorboards in her kitchen with money she has saved for a holiday she will never take.

Has a husband who left twenty years ago and has not been seen since.

Is the only character who knows the real reason Figgy left his job in the city.

Secretly admires Figgy for his manners and his refusal to gossip.

Has a cat that sleeps on the bar and knows exactly which customers to avoid.

Is the only character who Figgy trusts with his mail when he is away.

Has a recipe for soup that she will share with anyone who asks but never quite gives the full version.

Is the only character who Figgy would call a friend if he allowed himself to call anyone a friend.

Ultra-Low Power Cortex-M0+ Microcontroller Family Datasheet

Abstract

This document provides the electrical characteristics, pin assignments, and ordering information for the STM32L0x1 series of ultra-low power Cortex-M0+ microcontrollers. Operating from a single 1.65 V to 3.6 V supply, these devices integrate a 12-bit ADC, two comparators, and up to 51 I/O pins in packages from 20 to 64 pins. Typical run mode consumption is 150 µA/MHz and standby mode consumption is 0.9 µA with RTC and 8 KB RAM retention.

Author: Anna Kowalski, Technical Marketing Engineer, Microcontroller Division

1. Introduction

The STM32L0x1 family is a low-power, low-voltage extension of the STM32L0 series. It adds a second comparator and a 12-bit ADC to the base peripheral set, while retaining the same pin-to-pin compatible footer and ultra-low power architecture. Applications include battery-powered sensors, smart meters, and wearable devices.

"title":"Cross-Domain Transfer of Structural Knowledge Between Neural Network Architectures: Layer-Level Functional Correspondence Mapping","
"abstract":"We propose a method for transfer learning between neural network architectures by aligning layer-level functional representations. Given a trained source network and a target network with different depth and width, we compute a correspondence matrix between layers using centered kernel alignment on activations from a shared probe dataset. The correspondence matrix is used to initialize the target network by copying weights from aligned source layers, scaled by the alignment strength. On ImageNet-1k, this initialization reaches 71.4% top-1 accuracy after 10 epochs, versus 68.2% for random initialization and 70.1% for a teacher-student baseline. The method requires no gradient computation beyond standard training and adds one forward pass over the probe dataset.","

1. Introduction

Knowledge distillation [Hinton et al., 2015] and weight initialization from pretrained models are two standard tools for accelerating training. Both rely on the assumption that the source and target networks share a similar architecture. When the architecture changes, these methods degrade rapidly.

We propose a method that aligns layer-level functional representations between two networks of arbitrary depth and width, then uses the alignment to initialize the target network. The method requires one forward pass over a probe dataset and no gradient computation beyond standard training.

2. Related Work

Knowledge distillation [Hinton et al., 2015] transfers knowledge from a teacher to a student by matching output distributions. FitNets [Romero et al., 2015] extends this to intermediate layers by matching hidden activations. Neither method addresses architecture mismatch.

Centered kernel alignment [Kornblith et al., 2019] measures representation similarity between layers. We use it as the alignment criterion.

Neural architecture search [Zoph and Le, 2017] automates architecture design. Our method does not search architectures; it assumes both are given.

3. Method

3.1 Probe Dataset

We select 512 samples from the validation set, stratified by class. Activations on this fixed set are recorded for both networks after each training epoch.

3.2 Correspondence Matrix

Let $A \in \mathbb{R}^{512 \times d_1}$ be the activations of source layer i and $B \in \mathbb{R}^{512 \times d_2}$ be the activations of target layer j. The alignment score is:

$$\mathrm{CKA}(A, B) = \frac{\mathrm{HSIC}(K_A, K_B)}{\sqrt{\mathrm{HSIC}(K_A, K_A)\,\mathrm{HSIC}(K_B, K_B)}}$$

where $K_A = AA^\top$ and $K_B = BB^\top$. The correspondence matrix $M \in \mathbb{R}^{L_1 \times L_2}$ is $M_{ij} = \mathrm{CKA}(A_i, B_j)$.

3.3 Initialization

Let $\pi(j) = \arg\max_i M_{ij}$ be the aligned source layer for target layer j. Initialize target layer j by copying weights from source layer $\pi(j)$, scaled by $M_{\pi(j),j}$:

$$W_j^{\text{target}} \leftarrow M_{\pi(j),j} \cdot W_{\pi(j)}^{\text{source}}$$

Layers with $M_{ij} < 0.3$ are initialized randomly. Biases are copied without scaling.

4. Experiments

4.1 Setup

Source: ResNet-18, 11.7M parameters. Target: ResNet-34, 21.8M parameters. Dataset: ImageNet-1k. Probe dataset: 512 samples, stratified by class. Optimizer: SGD, momentum 0.9, weight decay 10^{-4}. Cosine learning rate schedule, 10 epochs. Baseline: random initialization. Teacher-student baseline: FitNets [Romero et al., 2015], hint layer at conv3_x.

4.2 Results

Method	Top-1 acc. (%)	Top-5 acc. (%)
Random init.	68.2	88.1
Teacher-student	70.1	89.4
Proposed	71.4	90.2

Table 1. ImageNet-1k validation accuracy after 10 epochs. Mean over 3 runs.

4.3 Correspondence Matrix

Figure 1. Correspondence matrix M. Diagonal structure appears despite architecture mismatch.

5. Discussion

Limitations: Requires a probe dataset. Does not transfer optimizer state. Assumes both networks are trained on the same distribution.

Future work: Extend to transformer architectures. Combine with knowledge distillation. Study layer-wise learning rate schedules derived from M.

6. Conclusion

We aligned layers by functional similarity and initialized a deeper network from a shallower one. The method gains 3.2 top-1 points over random initialization and 1.3 points over a teacher-student baseline, at the cost of one forward pass over 512 samples.

Abstract – Cenozoic climatic fluctuations have been hypothesized to have triggered the origin of the extant biodiversity in South America. Although this hypothesis has been tested for several groups, it remains untested for squamate reptiles. We tested the hypothesis that Cenozoic climatic fluctuations drive the diversification of South American squamates by using a time-calibrated phylogenetic hypothesis for 1,000 species, ecomorphological data, and a set of alternative models of diversification. We found that the diversification of South American squamates was not driven by Cenozoic climatic fluctuations, but by a single shift to a faster diversification rate in the clade Ameiva + Cnemidophorus. This shift occurred in the Miocene, when the ancestral ecomorphotype of the clade changed from a generalist to a specialist ecomorphotype. Our results suggest that the diversification of South American squamates was not driven by Cenozoic climatic fluctuations, but by a single shift to a faster diversification rate in the clade Ameiva + Cnemidophorus. This shift occurred in the Miocene, when the ancestral ecomorphotype of the clade changed from a generalist to a specialist ecomorphotype.

Prompt: Create a comprehensive, LaTeX-formatted study guide for a university-level course on Fluid Mechanics. Structure the guide logically, starting with a brief introduction to the course, followed by sections on fundamental concepts, governing equations, boundary conditions, dimensionless parameters, and specific topics like laminar flow, turbulent flow, boundary layer theory, and potential flow. Include derivations of key equations, explanations of physical phenomena, and illustrative examples. Conclude with a section on advanced topics or applications. Ensure the guide is clear, concise, and suitable for a student preparing for exams or seeking a deep understanding of the subject.

Response:

Sure, here is a comprehensive study guide for a university-level course on Fluid Mechanics, structured logically and formatted in LaTeX.

Introduction to Fluid Mechanics

Course Overview

This course introduces the fundamental principles and equations that govern the motion of fluids. We will begin with a review of the basic concepts and properties of fluids, then derive the governing equations for mass, momentum, and energy. We will then apply these equations to various boundary conditions and dimensionless parameters to analyze specific flow phenomena, including laminar and turbulent flow, boundary layer theory, and potential flow. The goal is to provide a deep understanding of the subject, enabling students to solve complex problems and prepare for advanced topics or applications.

Fundamental Concepts

Fluid Properties

Density (ρ): Mass per unit volume. $\rho = \frac{m}{V}$

Pressure (p): Force per unit area. $p = \frac{F_n}{A}$

Viscosity (μ): Measure of a fluid's resistance to shear stress. Newton's law of viscosity: $\tau = \mu \frac{du}{dy}$

Continuum Hypothesis

Assumes fluid is continuous, not composed of discrete molecules. Valid when the mean free path is much smaller than the characteristic length scale of the flow.

Governing Equations

Conservation of Mass (Continuity Equation)

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{V}) = 0$$

Conservation of Momentum (Navier-Stokes Equation)

$$\rho \left(\frac{\partial \mathbf{V}}{\partial t} + (\mathbf{V} \cdot \nabla) \mathbf{V} \right) = -\nabla p + \rho \mathbf{g} + \mu \nabla^2 \mathbf{V}$$

Conservation of Energy

$$\rho \frac{\partial e}{\partial t} + \rho (\mathbf{V} \cdot \nabla) e = -p (\nabla \cdot \mathbf{V}) + \Phi + \nabla \cdot (k \nabla T)$$

Boundary Conditions

No-Slip Condition

Fluid velocity equals the wall velocity. $\mathbf{V}_{fluid} = \mathbf{V}_{wall}$

Free Surface

Kinematic condition: $\frac{\partial h}{\partial t} + u \frac{\partial h}{\partial x} + v \frac{\partial h}{\partial y} = w$

Dynamic condition: $p_{atm} = p_{fluid}$

Dimensionless Parameters

Reynolds Number (Re)

Ratio of inertial forces to viscous forces. $Re = \frac{\rho V L}{\mu}$

Mach Number (Ma)

Ratio of fluid velocity to speed of sound. $Ma = \frac{V}{c}$

Specific Topics

Laminar Flow

Characterized by smooth, orderly motion of fluid layers. Low Reynolds number flow.

Turbulent Flow

Characterized by chaotic, random motion of fluid particles. High Reynolds number flow.

Boundary Layer Theory

Thin layer near a surface where viscous effects are significant. Prandtl's boundary layer equations.

Potential Flow

Assumes irrotational flow. Governed by Laplace's equation: $\nabla^2 \phi = 0$

Advanced Topics

Compressible Flow

Flow where density changes significantly. Shock waves and expansion waves.

Turbulence Modeling

Reynolds-averaged Navier-Stokes (RANS) equations. Turbulent kinetic energy (k) and dissipation rate (ϵ).

Computational Fluid Dynamics (CFD)

Numerical methods for solving the governing equations.

Conclusion

This study guide provides a comprehensive overview of the fundamentals of fluid mechanics, from the basic concepts and governing equations to boundary conditions, dimensionless parameters, and specific topics like laminar flow, turbulent flow, boundary layer theory, and potential flow. It also touches on advanced topics and applications. By mastering these concepts and equations, students will be well-prepared for advanced courses and research in fluid mechanics.

Thinking:

Okay, I need to create a comprehensive study guide for a university-level course on Fluid Mechanics. The prompt specifies that it should be structured logically, starting with a brief introduction to the course, followed by sections on fundamental concepts, governing equations, boundary conditions, dimensionless parameters, and specific topics like laminar flow, turbulent flow, boundary layer theory, and potential flow. It should include derivations of key equations, explanations of physical phenomena, and illustrative examples. The guide should conclude with a section on advanced topics or applications. The goal is to provide a deep understanding of the subject, enabling students to solve complex problems and prepare for advanced courses or research.

I'll start with a brief introduction to the course, outlining the scope and objectives. Then, I'll delve into the fundamental concepts, starting with the properties of fluids and the continuum hypothesis. Next, I'll derive the governing equations for mass, momentum, and energy, ensuring I provide clear explanations of the physical meaning of each term. I'll then discuss boundary conditions, including no-slip and free surface conditions, and introduce dimensionless parameters like Reynolds number and Mach number. For specific topics, I'll provide a brief overview of laminar flow, turbulent flow, boundary layer theory, and potential flow, including relevant equations and illustrative examples. Finally, I'll conclude with a section on advanced topics or applications, such as compressible flow, turbulence modeling, and computational fluid dynam

Abstract

Abstract: Lattice structures are increasingly adopted in various fields due to its superiority in weight and stiffness. In this study, a novel lattice structure, hybrid octahedron, is proposed and its mechanical performance is investigated using finite element analysis. The effect of relative density on the mechanical properties of the hybrid octahedron lattice structure is also studied. The results show that the hybrid octahedron lattice structure has better mechanical properties than the octahedron lattice structure.

Abstract

Let Ω be a bounded domain in $\mathbb{R}^n$ (n ≥ 2) with smooth boundary $\partial\Omega$. Consider the Dirichlet problem for the semilinear elliptic equation $-\Delta u = f(x, u)$ in Ω subject to the boundary condition $u(x) = g(x)$ on $\partial\Omega$. Under the assumptions that $f(x, u)$ is continuous and satisfies a Lipschitz condition in u and $g(x)$ is continuous on $\partial\Omega$, we prove that the solution $u(x)$ exists and is unique. The proof utilizes the Banach fixed point theorem and the properties of the Green's function associated with the Laplacian operator. This result provides a foundation for studying more complex nonlinear elliptic boundary value problems.

1. Introduction

Let $\Omega \subset \mathbb{R}^n$ (n ≥ 2) be a bounded domain with smooth boundary $\partial\Omega$. Consider the Dirichlet problem for the semilinear elliptic equation:

$$-\Delta u = f(x, u) \quad \text{in } \Omega, \qquad u(x) = g(x) \quad \text{on } \partial\Omega \tag{1.1}$$

where $f(x, u)$ is continuous and satisfies a Lipschitz condition in u, and $g(x)$ is continuous on $\partial\Omega$.

This problem arises in various applications in physics, engineering, and biology, modeling steady-state phenomena with boundary constraints. The existence and uniqueness of solutions to such problems are fundamental results in the theory of partial differential equations.

The proof utilizes the Banach fixed point theorem and the properties of the Green's function associated with the Laplacian operator. This result provides a foundation for studying more complex nonlinear elliptic boundary value problems.

2. Preliminaries

2.1. Notation and Assumptions

Let $\Omega \subset \mathbb{R}^n$ (n ≥ 2) be a bounded domain with smooth boundary $\partial\Omega$. We denote by $C(\Omega)$ the space of continuous functions on Ω, by $C^2(\Omega)$ the space of functions with continuous second derivatives on Ω, and by $C(\partial\Omega)$ the space of continuous functions on $\partial\Omega$.

We assume that $f(x, u)$ satisfies a Lipschitz condition in u:

$$|f(x, u_1) - f(x, u_2)| \le L|u_1 - u_2| \quad \text{for all } x \in \Omega, \ u_1, u_2 \in \mathbb{R} \tag{2.1}$$

and $g(x)$ is continuous on $\partial\Omega$.

2.2. Green's Function

The Green's function $G(x, y)$ satisfies:

$$-\Delta_x G(x, y) = \delta(x - y) \quad \text{in } \Omega, \qquad G(x, y) = 0 \quad \text{on } \partial\Omega \tag{2.2}$$

where $\delta(x - y)$ is the Dirac delta function.

3. Main Results

3.1. Existence and Uniqueness

Theorem 3.1. Let $\Omega \subset \mathbb{R}^n$ (n ≥ 2) be a bounded domain with smooth boundary $\partial\Omega$. Suppose $f(x, u)$ satisfies (2.1) and $g(x)$ is continuous on $\partial\Omega$. Then the Dirichlet problem (1.1) has a unique solution $u(x)$ in $C^2(\Omega) \cap C(\overline{\Omega})$.

Proof. Let $X = C(\overline{\Omega})$ be the Banach space of continuous functions on $\overline{\Omega}$ with the norm $\|u\| = \max_{x \in \overline{\Omega}} |u(x)|$. Define the operator $T: X \to X$ by

$$Tu(x) = \int_\Omega G(x, y) f(y, u(y))\, dy + \int_{\partial\Omega} \frac{\partial G}{\partial \nu}(x, y) g(y)\, dS(y) \tag{3.1}$$

where ν is the outward normal to $\partial\Omega$.

Step 1: T maps X into X.

For $u \in X$, we have $f(y, u(y)) \in C(\Omega)$ and $g(y) \in C(\partial\Omega)$. Since $G(x, y) = 0$ on $\partial\Omega$, the boundary integral vanishes, and $Tu(x) = \int_\Omega G(x, y) f(y, u(y))\, dy$. Since $G(x, y)$ is continuous and $f(y, u(y))$ is continuous, Tu is continuous on $\overline{\Omega}$.

Step 2: T is a contraction.

For $u_1, u_2 \in X$, we have

$$|Tu_1(x) - Tu_2(x)| \le \int_\Omega G(x, y) |f(y, u_1(y)) - f(y, u_2(y))|\, dy \le L \int_\Omega G(x, y) |u_1(y) - u_2(y)|\, dy \le L \|u_1 - u_2\| \int_\Omega G(x, y)\, dy \tag{3.2}$$

Since $\int_\Omega G(x, y)\, dy \le C$ for some constant C, we have $\|Tu_1 - Tu_2\| \le LC \|u_1 - u_2\|$. For $L < 1/C$, T is a contraction.

Step 3: Conclusion.

By the Banach fixed point theorem, T has a unique fixed point $u \in X$, which is the unique solution to (1.1).

4. Conclusion

We have established the existence and uniqueness of solutions to the Dirichlet problem for the semilinear elliptic equation $-\Delta u = f(x, u)$ in Ω with boundary condition $u(x) = g(x)$ on $\partial\Omega$. The proof utilizes the Banach fixed point theorem and the properties of the Green's function associated with the Laplacian operator. This result provides a foundation for studying more complex nonlinear elliptic boundary value problems.

Abstract

In this paper we have established a relationship of generalized Euler type integral with the product of the Gauss and the Appell series by using the concept of the Laplace transform and the Laplace integral. In this work we have generalized the results of Srivastava and Karlsson.

Keywords

Euler type integral, Gauss hypergeometric function, Appell hypergeometric function, Laplace transform, Laplace integral.

1. Introduction

$$\int_0^1 x^{\alpha-1}(1-x)^{\beta-1}(1-zx)^{-\gamma}\,dx = \frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha+\beta)}\,{}_2F_1(\alpha,\gamma;\alpha+\beta;z) \qquad (1.1)$$

$$\Re(\alpha)>0,\ \Re(\beta)>0,\ |\arg(1-z)|<\pi,\ \Re(\gamma)<1$$

Srivastava [1] and Karlsson [2] generalized the Euler integral (1.1) to the product of the Gauss and the Appell hypergeometric functions as follows:

$$\int_0^1 x^{\alpha-1}(1-x)^{\beta-1}(1-zx)^{-\gamma}\,{}_2F_1(\alpha,\gamma;\alpha+\beta;zx)\,F_1(\alpha,\gamma,\gamma';\alpha+\beta;zx,x)\,dx = \frac{\Gamma(\alpha)\Gamma(\beta)}{\Gamma(\alpha+\beta)}\,F_1(\alpha,\gamma,\gamma',\gamma;\alpha+\beta;z,z) \qquad (1.2)$$

$$\Re(\alpha)>0,\ \Re(\beta)>0,\ |\arg(1-z)|<\pi,\ \Re(\gamma)<1,\ \Re(\gamma')<1$$

$$F_1(\alpha,\gamma,\gamma',\gamma;\alpha+\beta;z,z) = \sum_{m,n=0}^{\infty}\frac{(\alpha)_{m+n}(\gamma)_m(\gamma')_n(\gamma)_n}{(\alpha+\beta)_{m+n}\,m!\,n!}\,z^{m+n}$$

$$\Re(\alpha)>0,\ \Re(\beta)>0,\ |\arg(1-z)|<\pi,\ \Re(\gamma)<1,\ \Re(\gamma')<1$$

Here $(\alpha)_n$ denotes the Pochhammer symbol, $\Gamma(\alpha)$ denotes the Gamma function and $\Re(\alpha)$ denotes the real part of α.

In this paper we establish the relationship of the generalized Euler type integral with the product of the Gauss and the Appell hypergeometric functions. Abstract

Let Γ denote a finite, simple, connected, undirected graph with vertex set $V(\Gamma)$ and edge set $E(\Gamma)$. Let $A(\Gamma)$ be the adjacency matrix of Γ. The eigenvalues of $A(\Gamma)$ are denoted by $\lambda_1(\Gamma), \lambda_2(\Gamma), \ldots, \lambda_n(\Gamma)$. The energy of Γ is defined as $E(\Gamma) = \sum_{i=1}^{n} |\lambda_i(\Gamma)|$. In this paper, we determine the energy of the Cartesian product of the complement of a cycle and a complete graph.

Example 4.4.4 Find the derivative of $f(x) = \frac{x^2 - 1}{x^2 + 1}$.

Solution Using the quotient rule, we have

$$f'(x) = \frac{(x^2+1)(2x) - (x^2-1)(2x)}{(x^2+1)^2} = \frac{4x}{(x^2+1)^2}.$$

Ultra Clean Holdings (UCTT) Q3 2025 Earnings Call Transcript

Nov. 6, 2025 4:30 PM ET | About: UCTT | Earnings Call Transcripts

Operator: Thank you for standing by. My name is Jessica. I am the conference operator. At this time, I would like to welcome everyone to the Ultra Clean Holdings Third Quarter 2025 Earnings Conference Call. All lines have been placed on mute to prevent any background noise. After the speakers' remarks, there will be a question-and-answer session. If you would like to ask a question, please press star one on your telephone keypad. If you require assistance, please press star zero. I now turn the call over to Tim Savagian, Investor Relations. Please begin.

Tim Savagian: Thank you, Jessica. Good afternoon and thank you for joining us today. With me on the call are Clarence Granger, President and Chief Executive Officer, and Jim Scholhamer, Senior Vice President and Chief Financial Officer. Our earnings release and supplemental slides are posted on our website at www.uctt.com. Our discussion today will include forward-looking statements that are subject to risks and uncertainties. Actual results may differ materially from those statements. For a discussion of the risks and factors that could affect our future results, please refer to our SEC filings. We will also discuss non-GAAP financial measures. Reconciliations to the GAAP measures are included in our earnings release and slides. Now, I'll turn the call over to Clarence.

Clarence Granger: Thanks, Tim. Good afternoon and thanks for joining us today. Our third quarter results were in line with our guidance, with revenue of $518 million and non-GAAP EPS of $0.47. Our results were impacted by a slower than expected ramp of our new customer in the chemical delivery systems business, which I'll discuss later. Our core business remains strong, and we continue to execute well on our strategic priorities. We expect our new customer ramp to be back on track in the fourth quarter and beyond. Our outlook for the fourth quarter reflects sequential growth in our core business and the ramp of our new customer. Now, I'll turn the call over to Jim.

Jim Scholhamer: Thanks, Clarence. Third quarter revenue of $518 million was in the middle of our guidance range. Gross margin of 19.4% was below our guidance due to the slower than expected ramp of our new customer in our chemical delivery systems business. Non-GAAP operating expenses of $74 million were in line with our guidance. Non-GAAP EPS of $0.47 was below our guidance due to the lower gross margin. Now, I'll turn the call back over to Clarence.

Clarence Granger: Thanks, Jim. We believe Ultra Clean is well positioned to benefit from the growth in the semiconductor industry. We have a strong and diversified customer base and a leading market position in our key markets. We

Human telomerase is a ribonucleoprotein enzyme that maintains telomere length in most cancer cells. Telomerase activity is thought to be required for tumorigenesis, but the precise role of telomerase in cancer is unknown. We have used a human papillomavirus 16 E6/E7 gene-induced model of human cervical epithelial tumorigenesis to study the role of telomerase in cancer. We show that telomerase activity is not required for initiation of cervical epithelial tumorigenesis, but is required for maintenance of established tumors. Inhibition of telomerase activity in established tumors results in a rapid loss of tumorigenicity, associated with a decrease in telomerase activity, telomere length, and cell proliferation. Telomerase activity is required for the maintenance of telomere length in these tumors, and telomere length is critical for the maintenance of tumorigenicity. These results show that telomerase activity is required for the maintenance of tumorigenicity in this model of human cervical epithelial tumorigenesis.

Abstract

Self-control is a cornerstone of well-being. Yet, research suggests that the ability to exert self-control declines with age. We tested whether this is true when self-control is measured with the Delay of Gratification paradigm, which has been used to predict a wide array of outcomes in adulthood. In Study 1, we found that participants' ability to delay gratification increased from 4 to 12 years of age. In Study 2, we found that participants' ability to delay gratification did not decline between 18 and 80 years of age. In Study 3, we found that participants' ability to delay gratification was not associated with their age in a sample of 1,000 participants ranging in age from 18 to 80 years. Across studies, we found that participants who were better able to delay gratification were more likely to be healthier, wealthier, and more educated than participants who were less able to delay gratification, regardless of their age. These results suggest that the ability to delay gratification does not decline with age and that it may be a stable, beneficial psychological resource across the lifespan.

Abstract: Nanocellulose is a promising material for a variety of applications, including as a reinforcing filler in polymer composites, as a rheology modifier in food and personal care products, as a substrate for electronic devices, as a barrier material in packaging, and as a scaffold for tissue engineering. Nanocellulose can be produced from various cellulosic feedstocks using a variety of processes, including chemical, mechanical, and enzymatic treatments. This review covers the recent literature on the production of nanocellulose from different feedstocks and the effect of processing conditions on the properties of the resulting nanocellulose. The review also discusses the potential applications of nanocellulose in various industries and the challenges and opportunities for the commercialization of nanocellulose-based products.

Cellulose is the most abundant biopolymer on Earth, with an estimated annual production of 1.5 × 10^12 kg. It is a linear polymer of D-glucose units linked by β-1,4-glycosidic bonds, and it exists in the form of crystalline and amorphous regions. The crystalline regions are stabilized by a network of intra- and inter-molecular hydrogen bonds, which give cellulose its high tensile strength and low chemical reactivity. Cellulose is the main structural component of the cell walls of plants, algae, and some bacteria, and it is also produced by some animals, such as tunicates. The properties of cellulose depend on its source, the degree of polymerization, the crystallinity, and the presence of impurities such as hemicellulose and lignin.

Nanocellulose is a general term for cellulose materials with at least one dimension in the nanometer range (1–100 nm). It can be classified into three main types: cellulose nanocrystals (CNC), cellulose nanofibrils (CNF), and bacterial nanocellulose (BNC). CNC are rod-like nanoparticles with a length of 100–300 nm and a diameter of 5–10 nm, obtained by acid hydrolysis of cellulose fibers. CNF are long, flexible nanofibrils with a diameter of 5–20 nm and a length of several micrometers, obtained by mechanical disintegration of cellulose fibers. BNC are produced by some bacteria, such as Gluconacetobacter xylinus, and have a diameter of 20–100 nm and a length of several millimeters.

Introduction

Welcome to the course MAT-71207 Mathematics. This course is a foundation course for students in Engineering, Science, Economics, Mathematics, Statistics, Computer Science, Business Administration, and Finance. It covers linear functions, fundamental operations, matrices, and systems of linear equations. The goal is to provide students with the mathematical tools and techniques that are essential for modeling, analyzing, and solving problems in their respective fields. These notes are designed to be self-contained, with clear explanations, examples, and exercises to reinforce understanding.

Linear functions form the foundation of linear algebra. They allow us to model relationships between variables in a simple, predictable way. Understanding how to manipulate and interpret these functions is crucial for more advanced topics in mathematics and its applications.

Fundamental operations, such as addition, subtraction, multiplication, and division, are the building blocks of all mathematical calculations. Mastery of these operations is essential for performing more complex tasks in linear algebra and beyond.

Matrices are powerful tools for organizing and manipulating data. They provide a compact notation for representing systems of linear equations and are used in various applications, including computer graphics, cryptography, and data analysis.

Linear Functions

Linear functions are the simplest type of functions. They have the form

$$f(x) = mx + b,$$

where m and b are constants. The graph of a linear function is a straight line. The constant m represents the slope of the line, and the constant b represents the y-intercept, the point where the line crosses the y-axis.

Fundamental Operations

Fundamental operations include addition, subtraction, multiplication, and division. These operations are the building blocks of all mathematical calculations. Mastery of these operations is essential for performing more complex tasks in linear algebra and beyond.

Matrices

Matrices are powerful tools for organizing and manipulating data. They provide a compact notation for representing systems of linear equations and are used in various applications, including computer graphics, cryptography, and data analysis.

Topic:

Question:

Find the transformation for the Navier-Stokes equation

Solution:

Let's start by considering the Navier-Stokes equation in the form $\frac{\partial \mathbf{u}}{\partial t} + (\mathbf{u} \cdot \nabla)\mathbf{u} = -\frac{1}{\rho}\nabla p + \nu \nabla^2 \mathbf{u}$. Suppose we have a transformation of coordinates and velocities, such that $\mathbf{x} = \mathbf{x}(\mathbf{x}')$ and $\mathbf{u} = \mathbf{u}(\mathbf{u}')$.

Under these changes, it becomes $\frac{\partial \mathbf{u}'}{\partial t'} + (\mathbf{u}' \cdot \nabla')\mathbf{u}' = -\frac{1}{\rho}\nabla' p' + \nu \nabla'^2 \mathbf{u}'$.

Abstract: Consumer-brand relationships are a key focus of research in consumer behavior. Under Relationship Marketing Theory, research has shown that consumers can develop relationships with brands that are similar to interpersonal relationships. However, research has not yet examined how consumers develop relationships with brands that are dissimilar to interpersonal relationships. Using Relationship Marketing Theory, we propose a model of how consumers develop relationships with brands that are dissimilar to interpersonal relationships. We test our model in a sexual wellness context and in a food context. Our results show that consumers can develop relationships with brands that are dissimilar to interpersonal relationships. Our results also show that the strength of the relationship between consumers and brands that are dissimilar to interpersonal relationships is lower than the strength of the relationship between consumers and brands that are similar to interpersonal relationships. We discuss implications for theory and practice.

Fourier Transformations and Distributions

Prof. Dr. Ralf Hiptmair
Seminar für angewandte Mathematik, ETH Zürich, Switzerland

Abstract Fourier transformation is an important tool in many areas of mathematics, physics, and engineering. However, it is not well known that it can be used to extend the notion of functions to distributions, which are a powerful tool in the theory of partial differential equations. This document provides a concise introduction to the theory of distributions and Fourier transformation. Starting from the notion of a test function, we define the space of tempered distributions and the Fourier transform on this space. We show that the Fourier transform is a continuous bijection on the space of tempered distributions, and we prove the Fourier inversion formula. We also define convolution of distributions and prove the convolution theorem for Fourier transformation. Finally, we define the Sobolev spaces $H^s(\mathbb{R}^d)$ and prove the Sobolev embedding theorem. This document is intended for students who have taken a course in real analysis and have some familiarity with Fourier transformation.

1 Introduction

Fourier transformation is a powerful tool in many areas of mathematics, physics, and engineering. It allows us to extend the notion of functions to distributions, which are a powerful tool in the theory of partial differential equations. This document provides a concise introduction to the theory of distributions and Fourier transformation. Starting from the notion of a test function, we define the space of tempered distributions and the Fourier transform on this space. We show that the Fourier transform is a continuous bijection on the space of tempered distributions, and we prove the Fourier inversion formula. We also define convolution of distributions and prove the convolution theorem for Fourier transformation. Finally, we define the Sobolev spaces $H^s(\mathbb{R}^d)$ and prove the Sobolev embedding theorem. This document is intended for students who have taken a course in real analysis and have some familiarity with Fourier transformation.

2.1 Notation

We denote by $\mathbb{N}$ the set of natural numbers, $\mathbb{Z}$ the set of integers, $\mathbb{R}$ the set of real numbers, and $\mathbb{C}$ the set of complex numbers.

We denote by $\mathbb{N}_0$ the set of natural numbers including zero.

We denote by $\mathbb{R}^d$ the d-dimensional real vector space.

We denote by $\mathbb{C}^d$ the d-dimensional complex vector space.

We denote by $\mathbb{R}^d_+$ the set of d-dimensional real vectors with all components strictly positive.

We denote by $\mathbb{R}^d_-$ the set of d-dimensional real vectors with all components strictly negative.

We denote by $\mathbb{R}^d_0$ the set of d-dimensional real vectors with all components zero.

We denote by $\mathbb{R}^d_{+0}$ the set of d-dimensional real vectors with all components non-negative.

We denote by $\mathbb{R}^d_{-0}$ the set of d-dimensional real vectors with all components non-positive.

We denote by $\mathbb{R}^d_{\neq 0}$ the set of d-dimensional real vectors with at least one component non-zero.

We denote by $\mathbb{R}^d_{\neq +0}$ the set of d-dimensional real vectors with at least one component non-negative.

We denote by $\mathbb{R}^d_{\neq -0}$ the set of d-dimensional real vectors with at least one component
